

# Australia Mining by the Numbers

Australia is one of the most important countries for the mining industry. Hosting substantial mineral resources for most commodities it ranks among the top for iron ore, zinc, nickel and cobalt. Notably, Australia remains the top producer of lithium with estimated production of 355.1 Mt of LCE in 2022.

The ASX hosts a substantial amount of global metals exploration companies. The junior and intermediate sectors raised a total of \$4.2 billion in 2022, down from \$8.5 billion in 2021. Despite this decrease, the ASX remains the second largest exchange for the mining industry just behind the TSX group of exchanges.

Given its mineral wealth, the ASX and government incentives to spend money raised on the exchange locally, Australia is the second largest exploration destination in the world behind Canada. Exploration allocations to Australia increased to \$2.3 billion in 2022 from \$1.9 billion in 2021. This saw drilling activity increase to 57,341 reported drill holes in 2022 at 661 distinct projects.
