Introduced in 1991, the S&P MidCap 400 provides investors with a benchmark for U.S. mid-sized companies, reflecting the distinctive risk/return characteristics of this piece of the market. The S&P MidCap 400, S&P 500® and S&P SmallCap 600®, which together form the S&P Composite 1500®, also serve as nonoverlapping, individual building blocks representing each size segment of the U.S. equity market.
Why U.S. Mid Caps Matter

Market Capitalization Coverage

The S&P MidCap 400 represents approximately 5% of the U.S. equity market and around 3% of the investable global stock market. The S&P 400® has distinct constituents from the S&P 500 and S&P 600®, allowing market participants to potentially target various size segments without overlapping constituents.

Global Market Capitalization

Chart based on index (float-adjusted) market capitalizations of S&P Global BMI and S&P Composite 1500 component indices and is provided for illustrative purposes. Past performance is no guarantee of future results. Domestic common stocks traded in the U.S., excluding ADRs, limited partnerships, mutual funds and warrants.

Global Relevance of U.S. Mid Caps

The breadth and depth of the U.S. equity market means that the U.S. mid-cap segment is as large as various countries’ equity markets. Comparing the float-adjusted market capitalization of the S&P 400 with that of local equity markets around the world, the S&P 400’s market capitalization is equivalent to Canada’s, and similar to that of the U.K. and China. Overlooking U.S. mid-cap companies may lead to missing a large portion of the global opportunity set.

The S&P MidCap 400 Has an Index Equity Market Capitalization Equivalent to Canada

Measuring the Mid-Cap Premium

The S&P 400 Has Outperformed since 1994

While the S&P 400 has historically displayed high correlation to the S&P 500 and S&P 600, it has outperformed over the last 28 years.

Performance of the S&P 500, S&P MidCap 400 and S&P SmallCap 600

Since December 1994, the S&P 400 posted an annualized total return of 12%, compared with the S&P 600 and S&P 500’s 11% and 10%, respectively. The S&P 400 outperformed in absolute terms and its risk-adjusted returns (return per unit of risk) were similar to the S&P 500, historically.

Performance of U.S. Capitalization Ranges since Dec. 30, 1994

An Index Approach to U.S. Mid Caps

Indexing Works in U.S. Mid Caps

Over most investment horizons, a majority of U.S. mid-cap active managers underperformed the S&P 400. Our S&P Indices versus Active (SPIVA®) U.S. Year-End 2022 Scorecard, shows that over half of mid-cap managers underperformed the benchmark in 16 of the past 22 years. In most years, the percentage of underperforming funds was well over 50%.

Active equity fund performance versus the benchmark typically worsened over longer time horizons; 94% of all U.S. mid-cap managers underperformed the S&P 400 over the 20-year period ending on Dec. 31, 2022.

Assets Indexed to the S&P 400

The growth of passive investing has been driven by the challenges of active management, including high fees, limited transparency, and a historically poor performance track record. At the end of 2021, S&P DJI estimates that USD 200 billion was indexed to the S&P 400, with an additional USD 100 billion benchmarked to the index.1 The chart below tracks the growth in indexed assets as well as the estimated fee savings from passive investing in instruments tied to the S&P 400.

Fee savings are estimated each year by taking the difference in expense ratios between active and index equity mutual funds, and multiplying this difference by the total value of indexed assets for the S&P 400. We estimate that the cumulative savings in management fees over the past 26 years is USD 17 billion, which is equivalent to the combined value of the Dallas Cowboys (NFL), New York Yankees (MLB), FC Barcelona (Soccer),2 “The One” in Bel Air, Los Angeles, and Leonardo da Vinci’s Salvator Mundi.3

Similar to the S&P 500, the S&P 400 also serves as the basis for a range of sector, factor and sustainability indices that expand the ecosystem even further.
Index Construction: Defining the U.S. Mid-Cap Universe

The S&P 400 comprises 400 companies, which are identified based on their market capitalization, liquidity, sector representation and other criteria. The market cap range of mid-cap stocks has evolved over time and is reviewed by the S&P U.S. Index Committee on an ongoing basis.

Distinguishing Mid Caps from Other Capitalization Ranges

Differences in Concentration

The S&P 400 has a smaller gap between the largest and smallest index weights compared to the S&P 500. Looking at constituent sizes at the end of March 2023, the average S&P 400 company was less than one-tenth the size of the average S&P 500 company and three times the size of the average S&P 600 constituent.

Closing the Gap Between the Large- and Small-Cap Segments

Some investors may overlook the potential benefits of U.S. mid caps and may simply allocate to large- and small-cap equities. But this risks overlooking a sizeable piece that some have considered a “sweet spot” of performance, historically.

The S&P 400 has distinct characteristics from its large- and small-cap counterparts, as highlighted below. Mid-cap companies tend to be more established than those in the S&P 600 but, unlike their large-cap counterparts, mid caps may not be in the mature phase of their business cycles.

There is also a fluid relationship between the three size segments. Several S&P 600 companies have been promoted to the S&P 400 and some mid-cap companies have matured into the S&P 500.

Sector and Economic Exposure of Mid Caps

S&P MidCap 400 Sectors

The mid-cap index’s sector exposures deviate from the S&P 500’s, with a higher exposure to more domestically focused sectors like Industrials, Real Estate and Consumer Discretionary. While the S&P 400 has an Information Technology sector weight comparable to many developed market countries, such as Japan, it has less exposure to tech than The 500™, with a 16% underweight as of March 31, 2023. This highlights that even within the U.S. equity market, a mid-cap equity allocation can be a diversifier when paired with the larger S&P 500.

**Higher Exposure to the U.S. Economy**

The S&P 400 is more correlated to U.S. GDP growth and components of GDP such as private investment and consumption than the S&P 500. The mid-cap index has also had a slightly greater percentage of revenue generated domestically when compared to its large-cap counterpart.

**Mid Caps Were More Highly Correlated to Domestic GDP Growth than Large Caps**
