Identifying the Differences Between VIX® Spot and Futures

CONTRIBUTOR

Berlinda Liu
Berlinda.liu@spdji.com

The S&P Dow Jones Indices Practice Essentials series is a curriculum-based, educational program covering selected financial markets, asset classes and indexing concepts.

Implied volatility is more than just a barometer for an investor's outlook of the equity market. In recent years, implied volatility has emerged as an important asset class. Exchange traded securities enable investors to access implied volatility easily—either to generate alpha or to hedge potential market risk. However, investors should understand the distinct characteristics of the popular volatility indices and products available in the marketplace before taking the plunge. In this paper, we will focus on two major implied volatility indices: the CBOE Volatility Index (VIX) and the S&P 500® VIX Short-Term Futures Index. We will also illustrate the difference between the spot VIX and VIX futures markets.

History of VIX

The concept of a volatility index dates back to 1987, when Professor Menachem Brenner and Professor Dan Galai designed the Sigma Index as an underlying asset for futures and options. On Jan. 19, 1993, the Chicago Board Options Exchange (CBOE) announced the launch of real-time reporting of the CBOE Volatility Index or VIX. Professor Robert Whaley developed the formula, and the calculation was based on the S&P 100 Index option prices. Ten years later, working with Goldman Sachs, the CBOE changed the VIX calculation methodology and the underlying securities used to calculate VIX. The new methodology is based on the variance swap model, and the calculation now uses S&P 500 Index options. For more information on this model, please refer to the whitepaper.

VIX is a popular measure of the implied volatility of S&P 500 index options. It represents the market's expectation of stock market volatility over the next 30 days. To calculate volatility, the index first takes as inputs the current market prices for all out-of-the-money S&P 500 calls and puts for the first and second month expirations. It then calculates the square root of the risk-neutral expectation of S&P 500 variance over the next 30 calendar days. The VIX is then quoted as an annualized standard deviation in percentage points. Research of volatility shows that VIX hits its highest levels during periods of market turbulence; hence VIX is often referred to as the "investor fear gauge." It is often seen as a diversification tool in a broad equity portfolio, especially when volatility tends to be more of a concern.

It is not possible to trade the spot VIX. Instead, investors take a position on the VIX through the use of VIX derivatives. In March 2004 and February 2006, the CBOE introduced futures and options based on the VIX. In January 2009, S&P Dow Jones Indices launched the S&P 500 VIX Futures Index Series. A variety of popular exchange traded products linked to these indices offer broad market access to volatility trading.

The S&P 500 VIX Short-Term Futures Index measures the return from a rolling long position in the first- and second-month VIX futures contracts. It maintains a constant one-month maturity by rolling continuously throughout each month from the first-month VIX futures into the second-month VIX futures contract. Exchange traded products linked to this index are among the most popular trading vehicles based on VIX.

Characteristics of VIX Spot and Futures

Similar to other spot-futures markets, the VIX futures and spot indices are closely related but have differences. Since Dec. 20, 2005, the S&P 500 VIX Short-Term Futures Index has been highly correlated with VIX (88.15% correlation). The index, however, does not track the VIX perfectly due to the distinct characteristics of the futures market.

Correlation With the Equity Market

Both the VIX spot and futures markets are negatively correlated with the S&P 500. Since Dec. 20, 2005, the S&P VIX Short-Term Futures Index has a correlation of -76.43% with the S&P 500, which explains how it can be seen as a hedge to potential market risk. In particular, when the equity market drops significantly, VIX tends to move up in both the spot and futures markets (See Exhibits 1 and 2).

Exhibit 1: Correlation with the S&P 500 Index

This chart may reflect hypothetical historical performance. Please see the Performance Disclosure at the end of this document for more information regarding the inherent limitations associated with back-tested performance.

Beta of VIX Futures

While futures markets tend to move together with the corresponding spot price, they tend to move in smaller increments. A shock in the spot market is usually muted in the futures market, and the VIX futures market is no exception. Exhibit 3 shows the daily returns of the VIX spot and futures markets on the 10 trading days with the biggest market drops since Dec. 20, 2005. Historically the S&P 500 VIX Short-Term Futures Index has a beta of 48.78% with the VIX spot, meaning it tracks about half of the spot movement on a daily basis.

Exhibit 3: Daily Returns of VIX Spot and Futures During the 10-Biggest Market Drops

Date	S&P 500 Return (%)	VIX Return (%)	S&P 500 VIX Short-Term Futures Index Return (%)
10/15/2008	-9.46	22.80	13.13
12/1/2008	-9.35	21.46	12.01
9/29/2008	-9.20	29.63	13.11
10/9/2008	-7.92	10.53	9.50
11/20/2008	-6.94	8.51	5.15
8/8/2011	-6.88	40.55	17.44
11/19/2008	-6.30	9.34	9.34
10/22/2008	-6.27	27.11	9.85
10/7/2008	-5.91	3.08	9.17
1/20/2009	-5.43	20.59	12.06

Roll Cost of VIX Futures

All futures have fixed expiration dates. As a result, the S&P 500 VIX Short-Term Futures index has to roll from the first month futures contract to the second-month futures contract before the first-month contract expires. This roll process contributes to the daily return of the futures index. When the market is in contango, longer-term futures are more expensive than shorter-term ones and a roll cost is incurred. Conversely, when the market is in backwardation, longer-term futures are cheaper than shorter-term futures, and the roll generates profit.

As with other futures-based indices, total return of the S&P 500 VIX Short-Term Futures Index can be broken into three components: return from the spot movement (spot yield), interest collected from the cash collateral (collateral yield) and the profit or loss from rolling to the next contract (roll yield). Exhibit 4 shows the decomposition of the monthly total returns of the S&P 500 VIX Short-Term Futures Index. Although the spot yield dominates in terms of magnitude, the roll yield effect is prominent. Since December 2005, in 80 out of 96 months (83.33%) the VIX futures market was in contango and generated a negative roll yield. Despite its small magnitude relative to the spot yield on a monthly basis, the accumulated roll yield has created a significant performance drag for the S&P 500 VIX Short-Term Futures Index (see Exhibit 5). VIX spot exhibits a mean-reverting return pattern, while the S&P 500 VIX Short-Term Futures Index trends down over the long term.

Please see the Performance Disclosure at the end of this document for more information regarding the inherent limitations associated with back-tested performance.

Key Takeaways

Both spot VIX and VIX futures are negatively correlated to the equity market. Investors use VIX's derivatives, including futures, to hedge market risk. However, VIX futures contracts do not track spot VIX perfectly. As such, investors should be aware of the distinct characteristics and limitations of using futures products as a hedge to their equity exposure. Since the S&P 500 VIX Short-Term Futures Index only tracks approximately half of the spot movement, it is important for investors to consider their appropriate hedge ratio. It should also be noted that the cost of rolling from the first-month futures to the second-month creates a long-term performance drag in the S&P 500 VIX Short-Term Futures Index. It is therefore worth noting that using the index as a long-term hedge can be generally expensive.

Performance Disclosure

The S&P 500 VIX Short Term Futures Index was launched Jan. 22, 2009 at market close. All information presented prior to the Launch Date is back-tested. Back-tested performance is not actual performance, but is hypothetical. The back-test calculations are based on the same methodology that was in effect when the index was officially launched. Complete index methodology details are available at www.spdji.com.

S&P Dow Jones Indices defines various dates to assist our clients in providing transparency on their products. The First Value Date is the first day for which there is a calculated value (either live or back-tested) for a given index. The Base Date is the date at which the Index is set at a fixed value for calculation purposes. The Launch Date designates the date upon which the values of an index are first considered live; index values provided for any date or time period prior to the index's Launch Date are considered back-tested. S&P Dow Jones Indices defines the Launch Date as the date by which the values of an index are known to have been released to the public, for example via the company's public Web site or its datafeed to external parties. For Dow Jones branded indices introduced prior to July 31, 2013, the Launch Date (which prior to July 31, 2013, was termed "Date of Introduction") is set at a date upon which no further changes were permitted to be made to the index methodology, but that may have been prior to the Index's public release date.

Past performance is not an indication of future results. Prospective application of the methodology used to construct the S&P Global Infrastructure Index, the S&P Emerging Markets Infrastructure Index, the Dow Jones Brookfield Global Infrastructure Index, and the Dow Jones Brookfield Emerging Markets Infrastructure Index may not result in performance commensurate with the back-test returns shown. The back-test period does not necessarily correspond to the entire available history of the index. Please refer to the methodology paper for the index, available at www.spdji.com for more details about the index, including the manner in which it is rebalanced, the timing of such rebalancing, criteria for additions and deletions, as well as all index calculations. It is not possible to invest directly in an Index.

Another limitation of back-tested hypothetical information is that generally the back-tested calculation is prepared with the benefit of hindsight. Back-tested data reflect the application of the index methodology and selection of index constituents in hindsight. No hypothetical record can completely account for the impact of financial risk in actual trading. For example, there are numerous factors related to the equities (or fixed income, or commodities) markets in general which cannot be, and have not been accounted for in the preparation of the index information set forth, all of which can affect actual performance.

The index returns shown do not represent the results of actual trading of investor assets. S&P/Dow Jones Indices LLC maintains the indices and calculates the index levels and performance shown or discussed, but does not manage actual assets. Index returns do not reflect payment of any sales charges or fees an investor would pay to purchase the securities they represent. The imposition of these fees and charges would cause actual and back-tested performance to be lower than the performance shown. In a simple example, if an index returned 10% on a US $100,000 investment for a 12-month period (or US$ 10,000) and an actual asset-based fee of 1.5% were imposed at the end of the period on the investment plus accrued interest (or US$ 1,650), the net return would be 8.35% (or US$ 8,350) for the year. Over 3 years, an annual 1.5% fee taken at year end with an assumed 10% return per year would result in a cumulative gross return of 33.10%, a total fee of US$ 5,375, and a cumulative net return of 27.2% (or US$ 27,200).

Disclaimer

It is not possible to invest directly in an index. Exposure to an asset class represented by an index is available through investable instruments based on that index. S&P Dow Jones Indices does not sponsor, endorse, sell, promote or manage any investment fund or other investment vehicle that is offered by third parties and that seeks to provide an investment return based on the performance of any index. S&P Dow Jones Indices makes no assurance that investment products based on the index will accurately track index performance or provide positive investment returns. S&P Dow Jones Indices LLC is not an investment advisor, and S&P Dow Jones Indices makes no representation regarding the advisability of investing in any such investment fund or other investment vehicle. A decision to invest in any such investment fund or other investment vehicle should not be made in reliance on any of the statements set forth in this document. Prospective investors are advised to make an investment in any such fund or other vehicle only after carefully considering the risks associated with investing in such funds, as detailed in an offering memorandum or similar document that is prepared by or on behalf of the issuer of the investment fund or other investment vehicle. S&P Dow Jones Indices LLC is not a tax advisor. A tax advisor should be consulted to evaluate the impact of any tax-exempt securities on portfolios and the tax consequences of making any particular investment decision. Inclusion of a security within an index is not a recommendation by S&P Dow Jones Indices to buy, sell, or hold such security, nor is it considered to be investment advice.
