Introduction

The S&P/BMV Indices are maintained by S&P Dow Jones Indices in agreement with the Bolsa Mexicana de Valores (BMV). The indices cover the Mexican and certain other equities markets as described below.

Index Objectives, Family and Highlights

S&P/BMV Bursa Optimo Index. The index is designed to measure the performance of the most liquid stocks listed on the BMV using a weighting scheme that takes into account float-adjusted market capitalization, liquidity, and fundamental variables.

S&P/BMV China SX20 Index. The index is designed to measure the performance of the largest and most liquid Chinese ADR and ADS listings on the NYSE or Nasdaq, as well as the BMV's SIC (International Quotation System). Index constituents are weighted by float-adjusted market capitalization, subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*.

S&P/BMV Dividend Index. The index is designed to measure the performance of the largest and most liquid stocks listed on the BMV that have been paying dividends. Index constituents are weighted by five year average dividend income, subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*.

S&P/BMV FIBRAS Index. The index is designed to measure the performance of a maximum of 20 of the most liquid Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS) listed on the BMV, based on value traded. Index constituents are weighted by float-adjusted market capitalization, subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*.

S&P/BMV Housing Index. The index is designed to measure the performance of the Mexican housing market. Index constituents are weighted by float-adjusted market capitalization.

S&P/BMV Analytical Sector Indices. The indices are designed to measure the performance of stocks listed on the BMV covering seven key sectors of the Mexican equities market. Index constituents are weighted by total market capitalization. The indices consist of the following:

- S&P/BMV Consumer Discretionary Sector Index
- S&P/BMV Consumer Staples Sector Index
- S&P/BMV Financials Sector Index
- S&P/BMV Health Care Sector Index
- S&P/BMV Industrials Sector Index
- S&P/BMV Materials Sector Index
- S&P/BMV Telecommunication Services Sector Index

S&P/BMV Economic Activity Indices. The indices are designed to measure the performance of stocks listed on the BMV covering various economic sectors of the Mexican equities market. Index constituents are weighted by float-adjusted market capitalization, subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*. The indices consist of the following:

- S&P/BMV Commercial Services Index
- S&P/BMV Construction Index
- S&P/BMV Manufacturing, Electricity, & Water Index
- S&P/BMV Mining & Agriculture Index

- S&P/BMV Financial Services Index
- S&P/BMV Retail & Distributors Index
- S&P/BMV Infrastructure & Transportation Index

S&P/BMV Investable Select Sector Indices. The indices are designed to measure the performance of stocks listed on the BMV covering key sectors of the Mexican equities market. Index constituents are weighted by float-adjusted market capitalization, subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*. The indices consist of the following:

- S&P/BMV Consumer Staples Select Sector Index
- S&P/BMV Industrials Select Sector Index
- S&P/BMV Financials Select Sector Index
- S&P/BMV Materials Select Sector Index

S&P/BMV IPC CompMx Index. The index is designed to serve as a broad benchmark for the Mexican equities market. The index measures the performance of Mexico domiciled stocks listed on the BMV that meet certain size and liquidity criteria. Index constituents are weighted by float-adjusted market capitalization, subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*. In addition, size segment and Global Industry Classification Standard (GICS®) sub-indices of the S&P/BMV IPC CompMx Index are also available:

- **S&P/BMV IPC LargeCap Index.** The index is designed to measure the performance of stocks representing the top 75% of the cumulative market capitalization within the S&P/BMV IPC CompMx Index.
- **S&P/BMV IPC MidCap Index.** The index is designed to measure the performance of stocks representing the next 20% of the cumulative market capitalization within the S&P/BMV IPC CompMx Index, excluding large-cap stocks.
- **S&P/BMV IPC SmallCap Index.** The index is designed to measure the performance of stocks representing the next 5% of the cumulative market capitalization within the S&P/BMV IPC CompMx Index, excluding large-cap and mid-cap stocks.
- **S&P/BMV IPC CompMx Ex-Financials Index.** The index is designed to measure the performance of all companies in the S&P/BMV IPC CompMx Index (the "Underlying Index"), excluding those companies classified as part of the GICS Financials Sector (Code: 40). Constituents are weighted by float-adjusted market capitalization, subject to the diversification requirements of the underlying index.

S&P/BMV Total Mexico Index. The index is designed to serve as a broad benchmark for the Mexican equities market. The index measures the performance of Mexico domiciled stocks, including Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS) and Mortgage trusts, listed on the BMV that meet certain size and liquidity criteria. Index constituents are weighted by float-adjusted market capitalization, subject to the diversification requirements as detailed in *Eligibility Criteria and Index Construction*.

S&P/BMV Total Mexico ESG Index. The S&P/BMV Total Mexico ESG Index is designed to be an ESG score-weighted index that measures the performance of stocks with high ESG scores meeting sustainability criteria. The index applies exclusions based on business activities & United Nations Global Compact (UNGC) scores. ESG stands for Environmental, Social, and Governance.

S&P/BMV Market Makers Index. The index is designed to measure the performance of BMV listed Mexican stocks that meet the requirements of maintaining active contracts with Market Makers to facilitate trading liquidity and diversification, as detailed in *Eligibility Criteria and Index Construction*.

S&P/BMV IPC Index. The index is designed to measure the performance of 35 of the largest and most liquid stocks listed on the BMV. Index constituents are weighted by float-adjusted market capitalization,

subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*. Leverage and Inverse versions of the index are also available:

- **S&P/BMV IPC 2X Leverage Daily Index.** The index is designed to reflect 200% of the return (positive or negative) of the S&P/BMV IPC Index, including dividends and price movements.
- **S&P/BMV IPC Inverse Daily Index.** The index is designed to reflect the inverse performance of the S&P/BMV IPC Index in order to assist those who are seeking a short position on Mexican equities.

S&P/BMV INMEX. The index is designed to measure the performance of 20 of the largest and most liquid stocks within the S&P/BMV IPC Index. Index constituents are weighted by float-adjusted market capitalization, subject to diversification requirements as detailed in *Eligibility Criteria and Index Construction*.

S&P/BMV Mexico-Brazil Index. The index is designed to measure the performance of the 10 most liquid stocks listed on the BMV and the 10 most liquid Brazilian ADR and ADS listings on the NYSE or Nasdaq, as well as the BMV's SIC (International Quotation System).

S&P/BMV Brazil 15 Index. The index is designed to measure the performance of the 15 largest and most liquid Brazilian ADR and ADS listings on the NYSE or Nasdaq, as well as the BMV's SIC (International Quotation System).

S&P/BMV IPC Quality, Value and Growth Index. The index is designed to measure the performance of stocks in the S&P/BMV IPC Index that have the highest combination of quality, value and growth, as determined by the multi-factor score calculation detailed in *Eligibility Criteria and Index Construction*.

S&P/BMV IPC Equal Weight Index. Index composition is the same as that of the underlying index (i.e. the S&P/BMV IPC Index). Constituents are equal weighted.

S&P/BMV Single Factor Indices. The S&P/BMV single factor select indices measure the performance of strategies that select the top 30% of stocks from the underlying index, based on their respective factors.

- **S&P/BMV IPC CompMx Quality Index.** The index measures the performance of stocks within the top 30% of the broad S&P/BMV IPC CompMx index based on their quality scores. Quality scores are calculated based on three fundamental measures: operating return on assets, accruals ratio and financial leverage ratio.
- **S&P/BMV IPC CompMx Short-Term Momentum Index.** The index measures the performance of stocks within the top 30% of the broad S&P/BMV IPC CompMx index based on their Momentum score. Momentum score is determined by short-term persistence in their relative performance, during the specified measurement period.
- **S&P/BMV IPC CompMx Enhanced Value Index.** The index measures the performance of stocks within the top 30% of the broad S&P/BMV IPC CompMx index based on their value scores. Value scores are calculated based on three fundamental measures: book value-to-price, operating income-to-enterprise value, and sales-to-price.

S&P/BMV Single Factor Indices – Weighted Versions. The S&P/BMV single factor indices measure the performance of strategies that overweight the S&P/BMV IPC CompMx or S&P/BMV IPC stocks relative to the underlying index in such a way that results in greater representation of specifically defined attributes versus the underlying index.

- **S&P/BMV IPC CompMx Quality Weighted Index.** Index constituents are weighted so that, relative to the underlying index, the S&P/BMV IPC CompMx, stocks with relatively high quality scores are overweight and stocks with relatively low quality scores are underweight. Quality scores are calculated based on three fundamental measures: operating return on assets, accruals ratio and financial leverage ratio.

- **S&P/BMV IPC CompMx Short-Term Momentum Weighted Index.** Index constituents are weighted so that, relative to the underlying index, the S&P/BMV IPC CompMx, stocks with relatively stronger price momentum are overweight and stocks with relatively weaker price momentum are underweight.
- **S&P/BMV IPC CompMx Enhanced Value Weighted Index.** Index constituents are weighted so that, relative to the underlying index, the S&P/BMV IPC CompMx, stocks with relatively higher value scores are overweight and stocks with relatively lower value scores are underweight. Value scores are calculated based on three fundamental measures: book value-to-price, operating income-to-enterprise value, and sales-to-price.
- **S&P/BMV IPC CompMx Risk Weighted Index.** Index constituents are weighted so that, relative to the underlying index, the S&P/BMV IPC CompMx, stocks with relatively lower volatility are overweight and stocks with relatively higher volatility are underweight. Volatility is defined as the standard deviation of the security's daily price returns in local currency over the prior one year of trading days.
- **S&P/BMV IPC Risk Weighted Index.** Index constituents are weighted so that, relative to the underlying index, the S&P/BMV IPC, stocks with relatively lower volatility are overweight and stocks with relatively higher volatility are underweight. Volatility is defined as the standard deviation of the security's daily price returns in local currency over the prior one year of trading days.

S&P/BMV Ingenius Index. The index measures the performance of large technology and tech-enabled companies with high S&P Growth Scores and listings on the NYSE or Nasdaq, as well as the BMV's SIC (International Quotation System). Index constituents are weighted by S&P Momentum Score, subject to the diversification requirements detailed in *Eligibility Criteria and Index Construction*.

Supporting Documents

This methodology is meant to be read in conjunction with supporting documents providing greater detail with respect to the policies, procedures and calculations described herein. References throughout the methodology direct the reader to the relevant supporting document for further information on a specific topic. The list of the main supplemental documents for this methodology and the hyperlinks to those documents is as follows:

Supporting Document	URL
S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology	Equity Indices Policies & Practices
S&P Dow Jones Indices' Index Mathematics Methodology	Index Mathematics Methodology
S&P Dow Jones Indices' Float Adjustment Methodology	Float Adjustment Methodology
S&P Dow Jones Indices' Global Industry Classification Standard (GICS) Methodology	GICS Methodology
S&P DJI ESG Score Methodology	S&P DJI ESG Score Methodology

This methodology was created by S&P Dow Jones Indices in agreement with the Bolsa Mexicana de Valores (BMV) to achieve the aforementioned objective of measuring the underlying interest of each index governed by this methodology document. Any changes to or deviations from this methodology are made in the sole judgment and discretion of S&P Dow Jones Indices and the BMV so that the index continues to achieve its objective.

Collaboration

Pursuant to an Index Operation and License Agreement dated May 2015 (the “Agreement”) between S&P Dow Jones Indices LLC (“S&P DJI”) and Bolsa Mexicana de Valores, S.A.B. DE C.V. (“BMV”), as amended, S&P DJI and BMV have agreed to jointly publish and co-brand a family of indices (the “Indices”). The Indices will be co-branded with the S&P/BMV naming convention on June 5, 2017 in conjunction with S&P Dow Jones Indices’ assumption of index calculation and maintenance. Prior to June 5, 2017, the Indices were calculated and maintained by BMV.

Eligibility Criteria and Index Construction

S&P/BMV Bursa Optimo Index

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV, excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS), Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E) and Mortgage Trusts.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Marketability Score.** A stock must have a Marketability Score.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Marketability Scores, is selected.

For more information on Marketability Scores, please refer to the *BMV Marketability Index Methodology* available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. All stocks in the Selection Universe are ranked based on their Marketability Scores. The 30 stocks with the highest liquidity, based on Marketability Scores, are selected and form the index.

Constituent Weightings. The index is non-market capitalization weighted. At each rebalancing, stocks are ranked by three factors: float-adjusted market capitalization (FMC), liquidity, and fundamental variable:

- **FMC and Liquidity Factors.** Stocks are sorted in descending order based on each factor (FMC and liquidity). For each factor, stocks are then ranked from 30 to 1 with the highest ranked stock getting a rank equal to 30. The rankings are then scaled so that the highest ranked stock gets a value of 1 (which represents 30 divided by 30) and the lowest ranked stock gets a value of 1 divided by 30. Each stock in between 1 and 30 gets a rank based on their actual rank divided by 30 in order to preserve the natural order.
- **Fundamental Variable Factor.** A fundamental variable is calculated for each stock in the index. The fundamental variable is based on the following five financial performance indicators:¹
 - Net Income
 - Net Debt/Equity Ratio
 - Operating Profit
 - Price/Earnings Ratio
 - Profit Margin (Net Income/Net Sales)

The procedure to calculate this factor is as follows:

1. Stocks are sorted in descending order based on each financial performance indicator. For each financial performance indicator, stocks are then ranked from 30 to 1 with the highest ranked stock getting a rank equal to 30. The rankings are then scaled so that the highest ranked stock gets a value of 1 (which represents 30 divided by 30) and the lowest ranked stock gets a value of 1 divided by 30. Each stock in between 1 and 30 gets a rank based on their actual rank divided by 30 in order to preserve the natural order.

¹ The financial performance indicators are based over a five-year period using annualized quarterly data. They are expressed as annual average growth rates.

2. After rankings are assigned to all stocks for each of the five performance indicators, an optimization process is used to determine the optimal set of allocation weights that when multiplied by each of the financial performance indicator rankings from Step 1 will achieve the highest possible Sharpe ratio.² The weight for each financial performance indicator is subject to a floor of 0.05 and all possible weight combinations are rounded up to the next 0.05.
3. Using the optimized set of weights from Step 2, multiply each of the five financial performance indicators rankings from Step 1 for each stock by the optimal weight allocation for that particular performance indicator. For example, Net Income, Operating Profit, Profit Margin, Net Debt/Equity ratio and Price/Earnings ratio will all have their own fixed optimal weight allocation. The same optimal weight allocations are used for all 30 stocks for each of the five performance indicators.
4. For each of the 30 stocks, take the sum of all five values from Step 3.
5. Sort the values from Step 4 in descending order. Find the maximum value and divide all the values from Step 4 by the maximum value. This will rescale the rankings so that the highest ranked stock gets a value of 1. This will also preserve the natural order. These scaled values become the final rankings for the Fundamental Variable Factor.

After rankings have been assigned for each of the three factors (FMC, liquidity, and fundamental variable), a joint rating is calculated for each of the 30 stocks by multiplying the three independent rankings by the following weight allocations and then taking the sum of the three weighted rankings:

- FMC: 30%
- Liquidity: 30%
- Fundamental variable: 40%

Divide each stock's joint rating by the aggregate joint ratings for all 30 stocks. This becomes each stock's weight in the index, subject to the following diversification requirements:

- At each rebalancing, each individual stock is subject to a weight cap of 25%.
- At each rebalancing, the aggregate weight of the five largest stocks cannot exceed 60%.

Rebalancing. Index composition is reconstituted annually, effective after the market close on the third Friday of June. The rebalancing reference date is the last business day of April. In addition, the index is reweighted outside of the annual rebalancing, effective after the market close on the third Friday of December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

² The Sharpe ratio is calculated by subtracting the annualized risk-free rate (28-day TIE) from the Bursa Optimo Index average daily returns and dividing the result by the standard deviation of the Bursa Optimo Index average daily returns. Average daily returns are annualized and calculated over the four months prior to the rebalancing reference date.

S&P/BMV China SX20 Index

Index Universe. The Index Universe consists of all stocks of Chinese companies that trade on NYSE and Nasdaq in the form of level II or level III ADRs and ADSs, that are also listed on the BMV's SIC (International Quotation System).

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must have a trading history of at least six months.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Global Marketability Scores, is selected.

For more information on Marketability Scores, please refer to the BMV Marketability Index Methodology available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. All stocks in the Selection Universe are ranked based on the following:

1. **Marketability Factor.** Stocks are ranked in descending order based on their average Global Marketability Score over the six-month period prior to the rebalancing reference date.

If a stock has traded for less than six months on the BMV's SIC, the available monthly values will be averaged using a value of 0 for non-SIC trading months over the reference period for the average Global Marketability Score calculation.

2. **VWAP FMC.** Stocks are ranked in descending order based on their VWAP FMC. The VWAP FMC is calculated by multiplying the number of shares outstanding by the assigned company's IWF and by the VWAP (Volume Weighted Average Price) over the six-month period prior to the rebalancing reference date.

After rankings for each of the above factors have been assigned to all stocks in the Selection Universe, a joint rating is calculated for each stock by adding up the two rankings.

The 20 stocks with the lowest joint ratings are selected and form the index.

In cases where two or more stocks have the same joint rating, the stock with the highest VWAP FMC is selected.

Constituent Weightings. The index is weighted based on FMC, subject to a single stock weight cap of 10%.

Rebalancing. Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. In addition, the index is reweighted outside of the semi-annual reconstitutions, effective after the market close on the third Friday of June and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV FIBRAS Index

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV that are classified as Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS).

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must not have five or more non-trading days over the prior three-month period.
- **Multiple Share Classes.** If a company has multiple share classes, the share class with the highest value traded is selected.

Constituent Selection. All stocks in the Selection Universe are ranked based on value traded. Value traded is represented by the median of the monthly medians of value traded for the prior six-month period. The monthly median daily value traded (MDVT) is defined as the median of the daily value traded for a given company in a given month. The value traded is calculated by multiplying the number of shares traded by each stock's price.

The 20 highest ranking stocks, based on value traded, are selected and form the index. If the Selection Universe consists of fewer than 20 stocks, then all stocks in the Selection Universe are selected and form the index.

Constituent Weightings. The index is weighted by FMC, subject to the following constraints:

- No single stock's weight can exceed 25%.
- The aggregate weight of stocks with weights greater than 15% cannot exceed 60%.
- The weight of any individual stock is restricted to a maximum liquidity weight calculated as each stock's six-month MDVT divided by the sum of the six-month MDVT for all stocks in the index, multiplied by three. Note that the capping algorithm redistributes the excess weight to the other stocks in proportion to their initial weights. Where the capping algorithm fails, the liquidity weight cap is relaxed by 0.5 in each iteration until a solution is found.

Rebalancing. The index is rebalanced semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of April and October, respectively. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV Dividend Index

Index Universe. The Index Universe consists of all stocks in the S&P/BMV IPC Index adjusted for any composition changes due to the current rebalancing.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must have a trading history of at least three months.
- **Dividend Payments.** For a given stock, dividends must have been paid for at least four years in the prior five-year period. Companies are excluded if they eliminate their latest scheduled dividend payment or cancel their subsequent scheduled dividend.
- **Marketability Score.** A stock must have a Marketability Score.

For more information on Marketability Scores, please refer to the *BMV Marketability Index Methodology* available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. All stocks in the Selection Universe are ranked based on the following:

1. **Turnover Factor.** This factor is calculated as follows:
 - a. Calculate the median share volume (Subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations) for each month, for the trailing 12 months leading up to the rebalancing reference date.
 - b. Divide each of the monthly median share volume figures by the float-adjusted shares outstanding. The float-adjusted shares outstanding are as of the same date that is used for the median share volume. For example, if the median share volume for a given stock is from the 15th of the month, the float-adjusted shares outstanding are also as of the 15th of that same month. This is the monthly turnover ratio.
 - c. Determine the median of the available monthly turnover ratios from Step 1b.
 - d. Divide the median monthly turnover ratio for each company calculated in Step 1c by the maximum median monthly turnover ratio calculated in the sample.
2. **Marketability Factor.** Stocks are ranked in descending order based on their Marketability Score as of the rebalancing reference date. The factor is calculated by dividing the top ranked stock (i.e. rank of 1) by each stock's rank.
3. **Dividend Yield Factor.** This factor is calculated as follows:
 - a. Calculate the average annual dividend yield for the last five complete calendar years prior to the rebalancing reference date. Dividend types included in the calculation are regular cash dividends, special dividends, and stock dividends.
 - b. Smooth the average dividend yield by dividing each company's average yield calculated in Step 3a by the maximum average yield calculated in the sample.

A joint rating is then calculated for each of the stocks in the Selection Universe by multiplying the three independent factors previously calculated by the following weight allocations:

- Turnover Factor: 5%
- Marketability Factor: 25%
- Dividend Yield: 70%

The sum of the resulting weighted factors is the joint rating for each stock.

The 20 stocks with the highest joint rating are selected and form the index.

In cases where two or more stocks have the same joint rating, the stock with the highest FMC is selected.

Constituent Weightings. The index is weighted based on each stock's five year average income, defined as the five year rolling average of the annual dividend amount per share multiplied by the shares outstanding and by the float factor, subject to the following constraints:

- No single stock's weight can exceed 10%.
- The annual dividend per share figure includes regular cash dividends, special dividends, and stock dividends.

Rebalancing. Index composition is reconstituted annually, effective after the market close on the third Friday of March. The rebalancing reference date is the last business day of January. In addition, the index is reweighted quarterly outside of the annual rebalancing, effective after the market close on the third Friday of June, September, and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV Housing Index

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV that are classified as part of the House Building (3411) sub-industry in accordance with the BMV's proprietary industry classification system.

For more information on the BMV's proprietary industry classification system, please refer to the BMV's Sector Classification Structure available at www.bmv.com.mx/en/markets/classification.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must have a trading history of at least three months. In addition, stocks must have traded on at least 80% of the available trading days over the prior 12-month period as of the rebalancing reference date. For stocks with less than 12 months of trading history (e.g. initial public offerings), the threshold is applied to the available trading history.
- **Liquidity.** Stocks must be categorized in the high, medium or low liquidity tiers, based on Marketability Scores from two months prior to the rebalancing date. For example, Marketability Scores from July are used for the annual rebalancing, effective after the market close on the third Friday of September.
- **Investable Weight Factor (IWF).** Stocks must have an IWF of at least 0.12.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Marketability Scores, is selected.

For more information on Marketability Scores, please refer to the BMV Marketability Index Methodology available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. All stocks in the Selection Universe are selected and form the index.

Constituent Weightings. The index is weighted based on FMC.

Rebalancing. Index composition is reconstituted annually, effective after the market close on the third Friday of September. The rebalancing reference date is the last business day of July. In addition, the index is reweighted quarterly, effective after the market close on the third Friday of March, June, and December.

S&P/BMV Analytical Sector Indices

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV, excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS), Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E) and Mortgage Trusts.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Marketability Scores, is selected.
- **Marketability Score.** A stock must have a Marketability Score.

For more information on Marketability Scores, please refer to the BMV Marketability Index Methodology available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. Stocks from the Selection Universe are selected as follows:

1. Stocks are categorized into one of ten sectors, in accordance with the BMV's proprietary industry classification system. Stocks in the following seven sectors are eligible:³
 - Consumer Discretionary & Services
 - Consumer Staples
 - Financial Services
 - Health Care
 - Industrials
 - Materials
 - Telecommunication Services

For more information on the BMV's proprietary industry classification system, please refer to the BMV's Sector Classification Structure available at www.bmv.com.mx/en/markets/classification.

2. Stocks in each sector category are selected and form the respective corresponding S&P/BMV Analytical Sector Index.

Constituent Weightings. Each stock in the index is weighted based on total market capitalization.

Rebalancing. Index composition is reconstituted annually, effective after the market close on the third Friday of March. The rebalancing reference date is the last business day of January. In addition, each index is reweighted quarterly outside of the annual rebalancing, effective after the market close on the third Friday of June, September, and December.

³ At each rebalancing, if a given S&P/BMV Analytical Sector Index does not have any eligible stocks, that index will not be calculated.

S&P/BMV Economic Activity Indices

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV, excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS), Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E) and Mortgage Trusts.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must have a trading history of at least three months. In addition, stocks must have traded on at least 80% of the available trading days over the prior 12-month period as of the rebalancing reference date. For stocks with less than 12 months of trading history (e.g. initial public offerings), the threshold is applied to the available trading history.
- **Liquidity.** Stocks must be categorized in either the high or medium liquidity tiers, based on Marketability Scores from two months prior to the rebalancing date. For example, Marketability Scores from April are used for the annual rebalancing, effective after the market close on the third Friday of June.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Marketability Scores, is selected.

For more information on Marketability Scores, please refer to the *BMV Marketability Index Methodology* available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. Stocks from the Selection Universe are selected as follows:

1. Stocks are categorized into one of the following economic activity clusters detailed in the following table:

Index	Economic Activity Clusters
S&P/BMV Commercial Services Index	Commerce and Services
S&P/BMV Construction Index	Construction
S&P/BMV Financial Services Index	Financial Services
S&P/BMV Infrastructure & Transportation Index	Infrastructure and Transportation
S&P/BMV Manufacturing, Electricity, & Water Index	Manufacturing, Electricity, Gas and Water
S&P/BMV Mining & Agriculture Index	Mining and Agriculture
S&P/BMV Retail & Distributors Index	Retail & Distributors

Each Economic Activity Cluster is made up of the sub-industries specified in *Appendix I*. Stocks are categorized into the sub-industries in accordance with the BMV's proprietary industry classification system.

For more information on the BMV's proprietary industry classification system, please refer to the *BMV's Sector Classification Structure* available at www.bmv.com.mx/en/markets/classification.

2. Stocks in each Economic Activity Cluster category are selected and form the respective corresponding S&P/BMV Economic Activity Index.
3. If the constituent count of a given index is less than 10 at the annual rebalancing, then the liquidity criterion is relaxed so that the index can also include eligible stocks classified in the low liquidity tier. The methodology aims to include at least 10 stocks in an index. However, there is no formal minimum constituent count and at times an index may fall below 10 constituents.

Constituent Weightings. Each index is weighted based on FMC, subject to a single stock weight cap of 12%.⁴

Rebalancing. Index composition is reconstituted annually, effective after the market close on the third Friday of June. The rebalancing reference date is the last business day of April. In addition, each index is reweighted quarterly outside of the annual rebalancing, effective after the market close on the third Friday of March, September, and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

⁴ Weight capping is not applied if the constituent count falls below 10.

S&P/BMV Investable Select Sector Indices

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV, excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS), Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E) and Mortgage Trusts.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must have a trading history of at least three months. In addition, stocks must have traded on at least 80% of the available trading days over the prior 12-month period as of the rebalancing reference date. For stocks with less than 12 months of trading history (e.g. initial public offerings), the threshold is applied to the available trading history.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Marketability Scores, is selected.
- **Investable Weight Factor (IWF).** Stocks must have an IWF of at least 0.12.

Constituent Selection. Stocks from the Selection Universe are selected as follows:

1. Stocks are categorized into one of ten sectors in accordance with the BMV's proprietary industry classification system. Stocks in the following four sectors are eligible:
 - Consumer Staples
 - Financial Services
 - Industrials
 - Materials

For more information on the BMV's proprietary industry classification system, please refer to the BMV's Sector Classification Structure available at www.bmv.com.mx/en/markets/classification.

2. Stocks in each sector category that are classified as being in either the high or medium liquidity tiers, based on Marketability Scores from two months prior to the rebalancing date, are selected and form the respective corresponding S&P/BMV Investable Select Sector Index. For example, Marketability Scores from January are used for the annual rebalancing effective after the market close of the third Friday of March.

For more information on Marketability Scores, please refer to the BMV Marketability Index Methodology available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODODOLOGY.PDF.

3. If the constituent count of a given index is less than 10 at the annual rebalancing, then Step 2 is relaxed so that the index can also include eligible stocks classified in the low liquidity tier. The methodology aims to include at least 10 stocks in an index. However, there is no formal minimum constituent count and at times an index may fall below 10 constituents

Constituent Weightings. Each index is weighted based on FMC, subject to a single stock weight cap of 12%.⁵

Rebalancing. Index composition is reconstituted annually, effective after the market close on the third Friday of March. The rebalancing reference date is the last business day of January. In addition, each index is reweighted quarterly outside of the annual rebalancing, effective after the market close on the third Friday of June, September, and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

⁵ Weight capping is not applied if the constituent count falls below 10.

S&P/BMV IPC CompMx Index and S&P/BMV Total Mexico Index

Index Universe. The Index Universe for each index is defined as follows:

S&P/BMV IPC CompMx. All stocks in the equity market listed on the BMV, excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS), Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E) and Mortgage Trusts.

S&P/BMV Total Mexico Index. All stocks in the equity market listed on the BMV, including Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS) and Mortgage Trusts, excluding Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E).

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Market Capitalization and Investable Weight Factor (IWF).** Stocks must have an IWF of at least 0.12 or a FMC of at least MXN10 billion.
- **Liquidity.** The liquidity criteria is as follows:
 - Stocks must have a monthly median traded value ratio (MTVR) of at least 1% over the prior three-month and 12-month periods, and a MDVT of at least MXN 4 million over the prior three-month period.
 - Current index constituents remain eligible if they have a MTVR of at least 0.5% over the prior three-month and 12-month periods, and a MDVT of at least MXN 2 million over the prior three-month period.
 - The monthly MTVR is determined as follows:
 1. Calculate the MDVT for every month.
 2. Calculate the number of days traded for every month.
 3. Calculate the month-end FMC.
 4. $MTVR = (\text{Result from Step 1} * \text{Result from Step 2}) / \text{Result from Step 3}$.
 5. Calculate the average MTVR for three months and 12 months.
- **Trading History.** The trading history criteria is as follows:
 - Stocks must have traded on at least 90% of the available trading days over the prior 12 month period.
 - For stocks with less than 12 months of trading history (e.g. initial public offerings), the 90% threshold is applied to the available trading history.
 - Current index constituents remain eligible if they have traded on at least 80% of the available trading days over the prior 12 month period and 95% over the prior three month period.
- **Multiple Share Classes.** If a company has multiple share classes, all share classes are eligible provided that they individually satisfy the other eligibility criteria. Each share class line included in the index is weighted based on its individual FMC.

Constituent Selection. All stocks in the Selection Universe are selected and form the index.

Constituent Weightings. The index is weighted based on FMC, subject to the following constraints:

- No single stock's weight can exceed 25%.

- The aggregate weight of the five largest stocks cannot exceed 60%.

Rebalancing. Index composition is reconstituted semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of April and October, respectively. In addition, the index is reweighted outside of the semi-annual reconstitutions, effective after the market close on the third Friday of March and September. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV IPC CompMx Ex-Financials Index

At each rebalancing all stocks in the underlying index, excluding those classified as part of the GICS Financials Sector (Code: 40), are selected and form the index.

GICS Reclassification. GICS classification is reviewed on a monthly basis, and index constituents whose classification becomes ineligible are deleted from the index at the time the reclassification occurs for the underlying index and added to the index if the stock is no longer classified as Financials Sector.

Index Maintenance. All index adjustments and corporate action treatments, including rebalancings, follow the underlying index.

Constituent weights. Constituents are weighted according to the rules of the underlying index.

S&P/BMV Total Mexico ESG Index

Approach. The index uses a transparent, rules-based, constituent selection process based on companies' ESG score resulting from the 'Corporate Sustainability Assessment' (CSA) conducted by SAM, a part of S&P Global. SAM uses the CSA results to then calculate the S&P DJI ESG Scores that are used in the index methodology. A company's ESG score may either be calculated from data received directly by a company completing the comprehensive assessment (together with supporting documents), or – in the absence of this – by using publicly available information.

For more information on the SAM CSA, please refer to <https://www.spglobal.com/esg/csa/indices/>.

For more information on S&P DJI ESG Scores, please refer to the S&P DJI ESG Scores Methodology.

For the purposes of ESG assessment, companies are assigned to industries defined by SAM and the assessment is largely specific to each industry. SAM uses the Global Industry Classification Standard (GICS®) as its starting point for determining industry classification. At the industry group and sector levels, the SAM Industries match the standard GICS classifications, but some non-standard aggregations are done at the industry level.)

The indices are generated and published under agreements between S&P Dow Jones Indices, Bolsa Mexicana de Valores, and SAM.

Index Universe. The index universe consists of all stocks in the S&P/BMV Total Mexico Index (the "Underlying Index") covered by Sustainalytics, adjusted for any composition changes due to the current rebalancing.

Companies without Sustainalytics coverage are ineligible for index inclusion until they receive such coverage.

For more information on Sustainalytics, please refer to <http://www.sustainalytics.com>.

As of each rebalancing reference date, companies with the following specific business activities, and/or companies classified as "Non-Compliant" by the United Nations Global Compact ("UNGC"), are excluded from the eligible universe:

Sustainalytics Category of Involvement	Sustainalytics Category of Involvement Description	Sustainalytics Involvement Proxy	S&P DJI Level of Involvement Threshold
Controversial Weapons: Tailor Made and Essential	The company is involved in the core weapon system, or components/services of the core weapon system that are considered tailor-made and essential for the lethal use of the weapon.	NA	>0%
Controversial Weapons: Significant Ownership (Tailor Made and Essential)	The company is involved (as above), through corporate ownership.		≥25% Ownership of Company ⁶
Tobacco: Production	The company manufactures tobacco products.	Revenue	>0%
Tobacco: Related Products/Services	The company supplies tobacco-related products/services.		≥10%
Tobacco: Retail	The company derives revenues from the distribution and/or retail sale of tobacco products.		≥10%
Tobacco: Significant ownership (production)	The company owns 10-50 per cent of another company with involvement in manufacturing tobacco products.		≥25%
Tobacco: Significant ownership (related products/services)	The company owns 10-50 per cent of another company with involvement in supplying tobacco-related products/services.		≥25%
Tobacco: Significant ownership (retail)	The company owns 10-50 per cent of another company with involvement in the distribution and/or retail sale of tobacco products.		≥25%

- **UNGC exclusions.**

- UNGC stands for United Nations Global Compact: Human Rights, Labor Rights, the Environment, and Anti-Corruption.
- Based on Sustainalytics information, if a company is classified as Non-Compliant, it will not be eligible.

Exclusions Based on ESG Score. If a company does not have an S&P DJI ESG Score, then it is excluded from the indices. For more information on S&P DJI ESG scores, please refer to the *S&P DJI ESG Score Methodology*.

Constituent Selection. Eligible companies from the underlying index are selected according to the following process:

1. Eligible companies are ranked in descending order, by S&P DJI ESG Score, as of the rebalancing reference date.
2. The top 80% of stocks, by count, with the highest S&P DJI ESG Scores are selected.
3. The selected stocks from Step 2 are ranked in descending order, by S&P DJI ESG Score, within their respective GICS Sector.
4. For each GICS Sector the top 75% of stocks, by count, with the highest S&P DJI ESG Scores, without going above the 75% threshold, are selected and form the index.

If after step 3 any particular sector has only one eligible stock, that stock is selected. Therefore, the company for this sector may fall outside the 75% threshold required criteria.

⁶ Prior to January 2019 Sustainalytics did not collect data on the corporate ownership indicator, so the index history does not reflect the impact of the indicator. From January 2019 forward the indicator is applied, along with the other categories of involvement indicators, at each rebalancing.

Constituent Weighting. At each rebalancing, constituents are weighted by S&P DJI ESG Score, subject to the following constraints:

- The aggregate weight of the five largest stocks cannot exceed 60%.
- The maximum weight of each security is the lower of 25% and four times its liquidity weight. Liquidity is based on the security's six-month MDVT.

Note that the capping algorithm redistributes the excess weight to the other stocks in proportion to their S&P DJI ESG Score weights. Where the capping algorithm fails, the liquidity weight cap will be increased by 0.5, repeated iteratively until a solution is found.

For more information on the index calculation methodology, please refer to the Non-Market Capitalization Weighted Indices section of S&P Dow Jones Indices' Index Mathematics Methodology.

Rebalancing. The index rebalances annually, after the market close on the third Friday of June. The rebalancing reference date is after the market close of the last business day of April. In addition, the index is reweighted quarterly outside of the annual rebalancing, effective after the market close on the third Friday of March, September, and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

Controversies: Media and Stakeholder Analysis Overlay. In addition to the above, companies may be deleted from the Index between annual reviews, if, through the Media & Stakeholder Analysis (MSA) component of the Corporate Sustainability Assessment (CSA), or by other means, the Index Committee determines that a company is no longer behaving in a matter that is consistent with the Corporate Governance Compliance. In the event that the Index Committee decides to remove a company in question, that company would not be eligible for reentry into the index for one full calendar year, beginning with the subsequent rebalancing.

In cases where risks are presented, SAM releases an MSA which includes a range of issues such as economic crime and corruption, fraud, illegal commercial practices, human rights issues, labor disputes, workplace safety, catastrophic accidents, and environmental disasters.

For more information on the Media & Stakeholder Analysis (MSA), please refer to Appendix II.

S&P/BMV IPC LargeCap, MidCap, and SmallCap Indices

Index Universe. The Index Universe consists of all stocks in the S&P/BMV IPC CompMx Index adjusted for any composition changes due to the current rebalancing.

Selection Universe. All stocks in the Index Universe that satisfy the following criterion as of the rebalancing reference date are selected and form the Selection Universe:

- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class based on the MTRV over the prior 12-month period is selected.

Constituent Selection. Size segments are based on the cumulative market capitalization within the S&P/BMV IPC CompMx. Companies are ranked by total market capitalization, and then FMC at the stock level is accumulated to 75% forming the S&P/BMV IPC LargeCap, the next 20% forming the S&P/BMV IPC MidCap, and the final 5% forming the S&P/BMV IPC SmallCap.

A +/- 3% buffer is applied to each index during rebalancing to minimize unnecessary turnover. For example, a current MidCap constituent meeting all eligibility requirements would transition to a LargeCap constituent if it is within the top 72% of cumulative FMC of all stocks, or a SmallCap constituent if it falls below 98% of the cumulative FMC. If the stock is between the 72-98% thresholds it will remain a MidCap constituent.

If a company has multiple share classes, the share classes are combined to measure the company's total market cap, and only the share class with the highest liquidity is selected.

A 10 stock minimum constituent count is required for each index.

Constituent Weightings. Each index is weighted based FMC, subject to the following constraints:

- No single stock's weight can exceed 25%.
- The aggregate weight of the five largest stocks cannot exceed 60%.
- The weight of any individual stock is restricted to a maximum weight calculated as each stock's six-month MDVT divided by the sum of the six-month MDVT for all stocks in the index, multiplied by two. If a stock's FMC weight exceeds the maximum weight, then that stock will be capped at its maximum weight and the excess weight will be redistributed proportionately to the remaining stocks that have not been capped.

Rebalancing. Each index is rebalanced semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of April and October, respectively. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV Market Makers Index

Index Universe. The Index Universe consists of all stocks in the S&P/BMV IPC CompMx Index adjusted for any composition changes due to the current rebalancing.⁷

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Multiple Share Classes.** Each company is represented once in the index. If a company has multiple share classes, the share class with the highest trading volume, as measured by six-month MDVT, is selected.
- **Market Maker Contract.** Each company must have an active contract with a Market Maker. Active contract data is provided by the BMV, via a publicly accessible link: https://www.bmv.com.mx/en/Grupo_BMV/Formador_de_mercado.

Constituent Selection. All stocks in the Selection Universe are selected to form the index, subject to a buffer rule.

Buffer Rule. In order to reduce turnover, a buffer of six months on the maturity of the market maker contract is applied to constituent stocks and is implemented as follows:

- At each reference date, if a current index constituent does not have an active contract with a market maker, and its previous contract has the maturity date within six months prior to the reference date, the stock will remain in the index.

Constituent Weightings. The index is weighted based on FMC, subject to the following constraints:

- The weight of any stock is restricted to 25%.
- The aggregate weight of the five largest stocks is restricted to 60%.
- The weight of any individual stock is restricted to a maximum weight calculated as each stock's six-month MDVT divided by the sum of the six-month MDVT for all stocks in the index, multiplied by two. If a stock's FMC weight exceeds the maximum weight, then that stock will be capped at its maximum weight and the excess weight will be redistributed proportionately to the remaining stocks that have not been capped.

Rebalancing. The index is rebalanced semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of April and October, respectively. Index shares are calculated using the closing prices seven business days prior to the rebalancing effective date.

⁷ For history prior to the market close of 16 June 2017, the Index Universe was the S&P Mexico BMI excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS) and Mortgage Trusts.

S&P/BMV IPC Index

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV, excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS), Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E) and Mortgage Trusts.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Investable Weight Factor (IWF).** Stocks must have an IWF of at least 0.10.
- **VWAP Float-Adjusted Market Capitalization.** The VWAP FMC must be at least MXN 10 billion (MXN 8 billion for current constituents). The VWAP FMC is calculated by multiplying the number of shares outstanding by the assigned company's IWF and by the VWAP over the prior three-month period.
- **Trading History.** The trading history criteria is as follows:
 - Stocks must have a trading history of at least three months.
 - Stocks must have traded on at least 95% of the available trading days over the prior six-month period.
 - For stocks with less than six months of trading history (e.g. initial public offerings), the 95% threshold is applied to the available trading history.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class based on the MTVR over the prior six-month period is selected.

Constituent Selection. All stocks in the Selection Universe are evaluated based on the following liquidity criteria using data as of the rebalancing reference date:⁸

- Stocks must have a MDVT of at least MXN 50 million (MXN 30 million for current constituents) over the prior three-month and six-month periods.
- Stocks must have an annualized MTVR of at least 25% over the prior three-month and six-month periods.
- Current index constituents remain eligible if they have an annualized MTVR of at least 15% over the prior three-month and six-month periods.
- The monthly MTVR is determined as follows:
 1. Calculate the MDVT for every month.
 2. Calculate the number of days traded for every month.
 3. Calculate the month-end FMC.
 4. $MTVR = (\text{Result from Step 1} * \text{Result from Step 2}) / \text{Result from Step 3}$.
 5. Aggregate the most recent three months and annualize to obtain the three-month MTVR. Aggregate the most recent six months and annualize to obtain the six-month MTVR.

If there are more than 35 eligible stocks, then the eligible stocks are ranked, in descending order, based on a combined ranking of VWAP FMC and six-month MDVT. The stocks with the greatest rankings are excluded until the constituent count reaches 35.

⁸ The daily value traded of each stock used in the liquidity screenings excludes the value traded of cross trades that exceeds the average of the market's cross trades activity plus 1.5 standard deviations. Daily Value Traded is calculated as volume * transaction price. Value Traded and Cross Trades data are sourced from the BMV.

If there are less than 35 eligible stocks, then stocks in the Selection Universe not meeting the constituent selection liquidity criteria are ranked, in descending order, based on a combined ranking of VWAP FMC and six-month MDVT. The stocks with the smallest rankings are added to the index until the constituent count reaches 35.

In cases where two or more stocks have the same combined ranking, the most liquid stock based on MDVT is selected.

Constituent Weightings. The index is weighted based on FMC, subject to the following constraints:

- No single stock's weight can exceed 25%.
- The aggregate weight of the five largest stocks cannot exceed 60%.

Rebalancing. Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. In addition, the index is reweighted outside of the semi-annual rebalancings, effective after the market close on the third Friday of June and December. Index shares are calculated using closing prices 12 business days prior to the respective March and September rebalancing effective date and seven business days prior to the respective June and December rebalancing effective date.

S&P/BMV IPC Equal Weight Index

Index Universe. The Index Universe consists of all stocks in the S&P/BMV IPC Index (the “Underlying Index”).

Index Construction. The index is an equal weighted version of the underlying index. Index composition is the same as the underlying index. Constituent changes are incorporated in the index as and when they are made in the underlying index.

When a company is added to an index in the middle of the quarter, it takes the weight of the company that it replaced. The one exception is when a company is removed from an index at a price of zero. In such a case, the company's replacement is added to the index at the weight using the previous day's closing value, or the most immediate prior business day that the deleted company was not valued at zero.

Constituent Weighting. At each quarterly rebalancing, constituents are equal weighted.

For more information on the index calculation methodology, please refer to the Equal Weighted Indices section of S&P Dow Jones Indices' Index Mathematics methodology.

Rebalancing. The index rebalances after the market close on the third Friday of the quarter-ending month with weights set to $1/N$ for each company in the index where N equals the number of companies in the index at rebalancing using the closing prices as of the second Friday of the last month of quarter as the reference price. Since index shares are assigned based on prices prior to the rebalancing, the actual weight of each company at the rebalancing differs from the target equal weights due to market movements.

S&P/BMV INMEX

Index Universe. The Index Universe consists of all stocks in the S&P/BMV IPC Index adjusted for any composition changes due to the current rebalancing.

Constituent Selection. All stocks in the Index Universe are ranked, in descending order, based on a combined ranking of Volume Weighted Average Price (VWAP) float-adjusted market capitalization and six-month MDVT. The 20 stocks with the smallest rankings are selected and form the index. The VWAP float-adjusted market capitalization is calculated by multiplying the number of shares outstanding by the assigned company's IWF and by the VWAP over the prior three-month period.

In order to reduce turnover, the selection process is subject to a two-stock buffer, whereby current index constituents remain in the index if they rank among the 22 stocks with the smallest rankings.

In cases where two or more stocks have the same combined ranking, the most liquid stock based on MDVT is selected.

Constituent Weightings. The index is weighted based on float-adjusted market capitalization, subject to a single stock weight cap of 10%.

Rebalancing. Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. In addition, the index is reweighted outside of the semi-annual rebalancings, effective after the market close on the third Friday of June and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV IPC 2X Leverage Daily and Inverse Daily Indices

S&P/BMV IPC 2X Leverage Daily Index. The index is designed to reflect 200% of the return (positive or negative) of the S&P/BMV IPC Index. The index value is calculated as follows:

$$\text{Leverage IndexValue}_t = \text{Leverage IndexValue}_{t-1} * \left[1 + \left[2 * \left(\frac{\text{Underlying Index}_t}{\text{Underlying Index}_{t-1}} - 1 \right) \right] \right]$$

where:

UnderlyingIndex_t = S&P/BMV IPC Index value on day t .

S&P/BMV IPC Inverse Daily Index. The index is designed to reflect the inverse performance of the S&P/BMV IPC Index in order to assist those who are seeking a short position on Mexican equities. The index value is calculated as follows:

$$\text{Inverse IndexValue}_t = \text{Inverse IndexValue}_{t-1} * \left[1 - \left(\frac{\text{Underlying Index}_t}{\text{Underlying Index}_{t-1}} - 1 \right) \right]$$

where:

UnderlyingIndex_t = S&P/BMV IPC Index value on day t .

S&P/BMV Mexico-Brazil Index

Index Universe. The Index Universe consists of all stocks in the equity market listed on the BMV, excluding Real Estate Investment Trusts (Fideicomiso de Inversión en Bienes Raíces or FIBRAS), Energy and Infrastructure Investment Trusts (Fideicomisos de Inversión en Energía e Infraestructura or FIBRAS E) and Mortgage Trusts and all stocks of Brazilian companies that trade on NYSE and Nasdaq in the form of level II or level III ADRs and ADSs, and are also listed in the BMV's SIC (International Quotation System).

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must have a trading history of at least six months.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Marketability Scores for Mexican Stocks and Global Marketability Scores for Brazilian ADRs and ADSs, is selected.

For more information on Marketability and Global Marketability Scores, please refer to the BMV Marketability Index Methodology available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. The constituent selection process is as follows:

1. All stocks in the Selection Universe are categorized by country and then ranked based on their average Marketability Score for Mexican stocks, and Global Marketability Scores for Brazilian ADRs and ADSs, over the prior six-month period.

If a stock has traded for less than six months on the BMV's SIC, the available monthly values will be averaged using a value of 0 for non-SIC trading months over the reference period for the average Global Marketability Score calculation.
2. The 10 Mexican stocks, and 10 Brazilian ADRs and ADSs, with the highest rankings are selected and form the index.
3. In cases where two or more stocks have the same ranking, the stock with the highest VWAP FMC is selected. VWAP FMC is determined by multiplying the number of shares outstanding by the assigned company's IWF and by the VWAP of the prior six-month period.

Constituent Weightings. The index is weighted based on FMC, subject to a single stock weight cap of 10%.

Rebalancing. Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. In addition, the index is reweighted outside of the semi-annual reconstitutions, effective after the market close on the third Friday of June and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV Brazil 15 Index

Index Universe. The Index Universe consists of all stocks of Brazilian companies that trade on NYSE and Nasdaq in the form of level II or level III ADRs and ADSs, and are also listed in the BMV's SIC (International Quotation System).

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Trading History.** Stocks must have a trading history of at least six months.
- **Multiple Share Classes.** If a company has multiple share classes, the most liquid share class, based on Global Marketability Scores, is selected.

For more information on Global Marketability Scores, please refer to the BMV Marketability Index Methodology available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_MARKETABILITY_INDEX_METHODOLOGY.PDF.

Constituent Selection. The constituent selection process is as follows:

1. All stocks in the Selection Universe are ranked in descending order based on their average Global Marketability Scores, over the prior six-month period.

If a stock has traded for less than six months on the BMV's SIC, the available monthly values will be averaged using a value of 0 for non-SIC trading months over the reference period for the average Global Marketability Score calculation.
2. All stocks in the Selection Universe are ranked in descending order based on their VWAP FMC. VWAP FMC is determined by multiplying the number of shares outstanding by the assigned company's IWF and by the VWAP of the prior six-month period.
3. A joint rank is calculated for each stock by adding up the ranks from Step 1 and Step 2 above. The 15 stocks with the lowest joint ranks are selected and form the index.
4. In cases where two or more stocks have the same ranking, the stock with the highest VWAP FMC is selected.

Constituent Weightings. The index is weighted based on FMC, subject to a single stock weight cap of 10%.

Rebalancing. Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. In addition, the index is reweighted outside of the semi-annual reconstitutions, effective after the market close on the third Friday of June and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

S&P/BMV IPC Quality, Value and Growth Index

Index Universe. The Index Universe consists of all stocks in the S&P/BMV IPC Index adjusted for any composition changes due to the current rebalancing.

- **Multiple Share Classes.** Each company is represented once in the S&P/BMV IPC Index by the company's primary listing, which is generally the company's most liquid share line.

Constituent Selection. The selection of index constituents is as follows:

1. Quality, Value and Growth z-scores are computed independently for each of the eligible stocks in the Index Universe. A security must have at least one fundamental z-score for each factor (Quality, Value and Growth) to be included in the index.
2. A stock is discarded if any of the factor scores is among the lowest four scores for that factor. Final multi-factor scores are calculated for a given selected security by the simple average of the underlying quality, value, and growth scores. See Constituent Weighting below for the multi-factor score formula.

For more information on the calculation of the quality, value and growth scores related to the index, please refer to Appendices II, III and IV.

Constituent Weighting. For a given rebalancing date, all the securities eligible for inclusion in the index are weighted by their final multi-factor score, which is the simple average of the underlying quality, value, and growth scores.

$$w_i = \frac{\text{Multi Factor score } i}{\sum_1^n \text{Multi Factor score } j}$$

$$\text{Multi - Factor Score}_i = (\text{Quality Score}_i + \text{Value Score}_i + \text{Growth Score}_i)/3$$

Rebalancing. The index is rebalanced semi-annually, effective after the close on the third Friday of June and December. The fundamental data reference dates are five weeks prior to each rebalance date.⁹ As part of the rebalancing process, constituent stock weights are updated. Weights calculated as a result of the reference date data are implemented in the index using closing prices as of the Wednesday prior to the second Friday of June and December.

⁹ For history prior to launch, the index rebalancing reference date was the close of the last business day of the month prior to the rebalancing month.

S&P/BMV Single Factor Indices

Index Universe. The index universe for the S&P/BMV single factor indices consist of all stocks that, on the rebalancing reference date, are members of the S&P/BMV IPC CompMx Index¹⁰. For a security to be eligible for consideration for the **S&P /BMV IPC CompMx Short-Term Momentum Index, S&P/BMV IPC CompMx Enhanced Value and S&P/BMV IPC CompMx Quality** the security must be a member of the index universe as of the rebalancing effective date. Constituents removed from an underlying headline universe index are also removed from the respective indices simultaneously.

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Multiple Share Classes.** Except for the S&P /BMV IPC CompMx Short-Momentum Index, each company is represented once by the Designated Listing. For more information regarding the treatment of multiple share classes, please refer to Approach B within the Multiple Share Classes section of the S&P Dow Jones Indices' Equity Indices Policies & Practices document. For the S&P /BMV IPC CompMx Short-Momentum Index, all publicly listed multiple share class lines are eligible for index inclusion, subject to meeting the eligibility criteria. For more information regarding the treatment of multiple share classes, please refer to Approach A within the Multiple Share Classes section of the S&P Dow Jones Indices' Equity Indices Policies & Practices document.
- **Liquidity Criteria.** Minimum MXN 4 million of six-month MDVT to be included in the index (MXN 2 million six-month MDVT for current constituents).

Constituent Selection. The selection of index constituents for the S&P/BMV IPC CompMx Quality, S&P/BMV IPC CompMx Short-Term Momentum, and S&P/BMV IPC CompMx Enhanced Value indices are as follows:

1. Factor adjusted scores are computed for each of the eligible stocks in the Index Universe. A security must have at least one fundamental z-score to be included in the index.
2. Select the top 30% securities of the eligible universe based on its respective factor score, subject to a minimum of 10 securities.

For more information on the calculation of the respective scores related to each index, please refer to the Appendix sections. Appendix II - Adjusted Quality Score; Appendix V – Enhanced Value Score; Appendix VI – Short-Term Momentum Score.

Buffer Rules. A 20% buffer is applied to stocks already in the index in order to reduce turnover and is implemented as follows:

- 1 Stocks are ranked based on factor score and those ranked within the top 24% of the stock count are automatically chosen for index inclusion.
- 2 All stocks which are current constituents that fall within the top 36% of the stock count are then chosen for index inclusion in order of their factor score.
- 3 If at this point 30% of stocks in the index universe have not been chosen, the remaining stocks are chosen based on their factor score.

Constituent Weighting. Each rebalancing date, all the securities eligible for inclusion in the index are weighted by their factor score, subject to security and liquidity constraints. This is done using a procedure such that the maximum weight of each security is the lower of 25% and four times its liquidity weight. Liquidity is based on the security's six-month MDVT.

¹⁰ The back-tested history prior to July 2017 is based on the S&P Mexico BMI excluding FIBRAS and ADRs.

Note that the capping algorithm redistributes the excess weight to the other stocks in proportion to their factor weights. Where the capping algorithm fails, the liquidity weight cap will be relaxed by 0.5 in each iteration, until a solution is found.

For more information on the calculation of the respective scores related to each index, please refer to the Appendix sections. Appendix II: Adjusted Quality Score; Appendix V: Enhanced Value Score; Appendix VI: Short-Term Momentum Score.

Rebalancing. The BMV Single-Factor Versions are rebalanced as follows:

- **S&P /BMV IPC CompMx Quality Index.** Index composition is reconstituted semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of May and November, respectively.
- **S&P /BMV IPC CompMx Enhanced Value Index.** Index composition is reconstituted semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of May and November, respectively.
- **S&P /BMV IPC CompMx Short-Term Momentum Index.** Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of February and August, respectively.

S&P/BMV Single Factor Indices – Weighted Versions

Index Universe. The index universe for the S&P/BMV single factor indices consist of all stocks that, on the rebalancing reference date, are members of the S&P/BMV IPC CompMx¹¹ adjusted for any composition changes due to the current rebalancing. For the S&P/BMV IPC Risk Weighted index, the underlying universe is the S&P/BMV IPC Index. For a security to be eligible for consideration for the **S&P/BMV IPC CompMx Short-Term Momentum Weighted Index, S&P/BMV IPC CompMx Quality Weighted and S&P/BMV IPC CompMx Enhanced Value Weighted** the security must be a member of the index universe as of the rebalancing effective date. Constituents removed from an underlying headline universe index are also removed from the respective indices simultaneously.

For a security to be eligible for consideration in the following indices, it must be a member of the relevant index universe as of the rebalancing effective date:

- **S&P/BMV IPC CompMx Short-Term Momentum Weighted Index**
- **S&P/BMV IPC CompMx Risk Weighted Index**
- **S&P/BMV IPC Risk Weighted Index**
- **S&P /BMV IPC CompMx Quality Weighted Index**
- **S&P /BMV IPC CompMx Enhanced Value Weighted Index**

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date are selected and form the Selection Universe:

- **Multiple Share Classes.** Except for the S&P/BMV IPC CompMx Short-Momentum Weighted Index, each company is represented once by the Designated Listing. For more information regarding the treatment of multiple share classes, please refer to Approach B within the Multiple Share Classes section of the S&P Dow Jones Indices' Equity Indices Policies & Practices document. For the S&P/BMV IPC CompMx Short-Term Momentum Weighted Index, all publicly listed multiple share class lines are eligible for index inclusion, subject to meeting the eligibility criteria. For more information regarding the treatment of multiple share classes, please refer to Approach A within the Multiple Share Classes section of the S&P Dow Jones Indices' Equity Indices Policies & Practices document.
- **Liquidity Criteria.** Minimum MXN 4 million of six-month MDVT to be included in the index. (MXN 2 million six-month MDVT for current constituents).
 - The S&P/BMV IPC Risk Weighted index, which considers all members of the S&P/BMV IPC index, does not require a liquidity criterion.
- **Traded History.** In addition to meeting the liquidity criterion mentioned above, some indices also require a minimum traded history. However, there is no minimum number of days that each stock must have actually traded.
 - Members of the S&P/BMV IPC CompMx Risk Weighted index must have been issued and trading for at least one calendar year, as of the reference date, before becoming eligible for index inclusion.
 - Members of the S&P/BMV IPC Risk Weighted index need to have a minimum traded history of at least one calendar year, as of the reference date, before becoming eligible for index inclusion.

Constituent Selection. The selection of index constituents for the S&P/BMV IPC CompMx Quality Weighted, S&P/BMV IPC CompMx Short-Term Momentum Weighted, and S&P/BMV IPC CompMx Enhanced Value Weighted indices is as follows:

¹¹ The back-tested history prior to July 2017 is based on the S&P Mexico BMI excluding FIBRAS and ADRs.

1. Factor adjusted scores are computed for each of the stocks in the eligible Index Universe. For Quality, Momentum, and Enhanced Value indices, a security must have at least one fundamental z-score for each factor to be included in the index.
2. All the securities of the eligible universe are selected.

Constituent Selection of “Risk Weighted” indices. All the eligible stocks in the respective Index Universe are selected to form the index.

For more information on the calculation of the respective scores related to each index, please refer to the Appendix sections. Appendix II: Adjusted Quality Score; Appendix V: Enhanced Value Score; Appendix VI: Short-Term Momentum Score, and Appendix VII – Volatility.

Constituent Weighting. Constituents of the S&P/BMV IPC CompMx Quality Weighted Index, S&P/BMV IPC CompMx Enhanced Value Weighted Index, and S&P/BMV IPC CompMx Short-Term Momentum Weighted Index are weighted as follows: For a given rebalancing date, all the securities eligible for inclusion in the index are weighted by their factor score, subject to security and liquidity constraints. This is done using a procedure such that the maximum weight of each security is the lower of 25% and four times its liquidity weight. Liquidity is based on the security’s six-month median daily value traded (six-month MDVT).

Note that the capping algorithm redistributes the excess weight to the other stocks in proportion to their factor weights. Where the capping algorithm fails, the liquidity weight cap will be relaxed by 0.5 in each iteration, until a solution is found.

For the S&P/BMV IPC CompMx Risk Weighted Index and S&P /BMV IPC Risk Weighted Index, the weight for each index constituent is set inversely proportional to its volatility. Volatility (Appendix VI) is defined as the standard deviation of the security’s daily prices returns over the prior 12 months, subject to security and liquidity constraints. This is done using a procedure such that the maximum weight of each security is the lower of 25% and four times its liquidity weight. Liquidity is based on the security’s six-month median daily value traded (six-month MDVT).

Note that the capping algorithm redistributes the excess weight to the other stocks in proportion to their factor weights. Where the capping algorithm fails, the liquidity weight cap will be relaxed by 0.5 in each iteration, until a solution is found.

For more information on the calculation of the respective scores related to each index, please refer to the Appendix sections. Appendix II: Adjusted Quality Score; Appendix V: Enhanced Value Score; Appendix VI: Short-Term Momentum Score; and Appendix VII: Volatility.

Rebalancing. The BMV Single-Factor Indices are rebalanced as follows:

- **S&P /BMV IPC CompMx Quality Weighted Index.** Index composition is reconstituted semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of May and November, respectively.
- **S&P /BMV IPC CompMx Enhanced Value Weighted Index.** Index composition is reconstituted semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of May and November, respectively.
- **S&P /BMV IPC CompMx Short-Term Momentum Weighted Index.** Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of February and August, respectively.
- **S&P /BMV IPC CompMx Risk Weighted Index.** Index composition is reconstituted quarterly, effective after the market close on the third Friday of March, June, September, and December. The rebalancing reference date is the last business day of February, May, August, and November, respectively.

- **S&P /BMV IPC Risk Weighted Index.** Index composition is reconstituted quarterly, effective after the market close on the third Friday of March, June, September, and December. The rebalancing reference date is the last business day of February, May, August, and November, respectively.

S&P/BMV Ingenius Index

Index Universe. The Index Universe consists of all constituents of the underlying index, adjusted for any composition changes due to that index's current rebalancing, that trade on the NYSE and Nasdaq as local listings or ADRs/ADS level II or level III, and are also listed in the BMV's SIC (International Quotation System).

Selection Universe. All stocks in the Index Universe that satisfy the following criteria as of the rebalancing reference date form the Selection Universe:

- **Growth Score.** Must have a growth score greater than or equal to 0.6.¹²
- **Float-Adjusted Market Capitalization (FMC).** Must have an FMC greater than or equal to USD \$50 billion.
- **GICS Sub-Industry.** Must be classified as part of the following GICS Sub-Industries:

Sector	Sub-Industry	Code
Communication Services	Interactive Media & Services	50203010
Communication Services	Movies & Entertainment	50202010
Consumer Discretionary	Internet & Direct Marketing Retail	25502020
Information Technology	Systems Software	45103020
Information Technology	Technology Hardware Storage & Peripherals	45202030
Information Technology	Data Processing & Outsourced Services	45102020
Information Technology	Semiconductors	45301020

- **Multiple Share Classes.** Each company is represented once by the Designated Listing. For more information regarding the treatment of multiple share classes, please refer to Approach B within the Multiple Share Classes section of the S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Constituent Selection. Eligible stocks are ranked in descending order based on the product of their Growth Score multiplied by their FMC prior to the rebalancing reference date. The top 12 stocks are selected for index inclusion, subject to a minimum of six. If six stocks are not selected, the next stock with the greatest product of their Growth Score multiplied by their FMC will be included until the six count is completed.

Constituent Weightings. At each rebalancing constituents are weighted by 12-month momentum score, subject to a single stock weight cap of 20%. *Please refer to Appendix VI for information on momentum score computation.*

Reconstitution. Index composition is reconstituted annually, effective after the market close on the third Friday of September. The reconstitution reference date is the last business day of July. In addition, the index is rebalanced quarterly, effective after the market close on the third Friday of March, June, and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.

¹² For information on Growth Score calculation, please refer to the *S&P Global BMI, S&P/IFCI Methodology*, available at www.spdji.com.

Index Maintenance

Index Calculations

The indices are calculated by means of the divisor methodology used in all S&P Dow Jones Indices' equity indices.

For more information on index calculations, please refer to S&P Dow Jones Indices' Index Mathematics Methodology.

Corporate Actions

The table below details the most common corporate actions and index treatment for the following indices:

- S&P/BMV Bursa Optimo Index
- S&P/BMV Dividend Index
- S&P/BMV FIBRAS Index
- S&P/BMV IPC LargeCap, MidCap, and SmallCap Indices
- S&P/BMV IPC Quality, Value and Growth Index
- S&P/BMV Total Mexico ESG
- S&P/BMV Single Factor Indices
- S&P/BMV Single Factor Indices – Weighted Versions
- S&P/BMV Market Makers Index
- S&P/BMV IPC Equal Weight Index
- S&P/BMV Ingenius Index

Corporate Action	Adjustment Made to Index	Divisor Adjustment?
Rights Offering	The price is adjusted to the Price of the Parent Company minus (the Price of the Rights Offering/Rights Ratio). Index shares change so that the company's weight remains the same as its weight before the rights offering.	No
Stock Dividend, Stock Split, Reverse Stock Split	Index shares are multiplied by and price is divided by the split factor.	No
Share Issuance, Share Repurchase, Equity Offering or Warrant Conversion	None.	No
Special Dividends	Price of the stock making the special dividend payment is reduced by the per share special dividend amount after the close of trading on the day before the dividend ex-date.	Yes
Constituent Change	Except for spin-offs, there are no intra-rebalancing additions.	-
	Deletions due to delistings, acquisition or any other corporate event resulting in the deletion of the stock from the index will cause the weights of the rest of the stocks in the index to change. Relative weights will stay the same.	Yes

Spin-Offs. Except for the indices detailed below, a spin-off is added to all indices of which the parent is a constituent at a zero price at the market close of the day before the ex-date. There is no divisor change. All key attributes of the spin-off are the same as the parent at the time of addition. The spin-off remains in the index and is evaluated for continued inclusion at the subsequent reconstitution.

For the following indices, the spin-off is added to the index at a zero price and is dropped from the index after the first day of regular way trading, provided the drop event has been announced at least two days prior to the drop date:

- S&P/BMV Bursa Optimo Index

- S&P/BMV Dividend Index
- S&P/BMV Ingenius Index
- S&P/BMV IPC Quality, Value, and Growth Index
- S&P/BMV Single Factor Indices
- S&P/BMV Single Factor Indices – Weighted Versions
- S&P/BMV Total Mexico ESG

For all other equity indices, corporate actions (such as stock splits, stock dividends, and rights offerings) are applied after the close of trading on the day prior to the ex-date. Share changes resulting from exchange offers are applied on the ex-date.

For more information, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Additions

Except for spin-offs, there are no additions between rebalancings.

S&P/BMV IPC Index. In the event that the index's constituent count falls below 30, the Index Committee will review the index to determine if replacement stocks are required in order to maintain the index objective. Advance notice will be provided prior to the addition of a replacement stock outside of the regularly scheduled index reconstitutions.

Deletions

Between rebalancings, deletions can occur due to acquisitions, mergers, takeovers, bankruptcies or delistings.

S&P/BMV Dividend Index Quarterly Review. In addition to the annual rebalancing, constituent stocks are reviewed on a quarterly basis. At the discretion of S&P Dow Jones Indices, if a constituent stock publicly announces a suspension to or cancellation of its dividend program, the stock may be removed effective prior to the open of the first business day of the following month and not replaced until the following reconstitution. Any changes are announced five business days prior to month-end. The decision to remove an index constituent is based on information publicly announced by the company as of seven business days prior to month-end.

S&P/BMV IPC Quality, Value and Growth Index. Constituents removed from the S&P/BMV IPC Index are removed from the index simultaneously.

S&P/BMV Single Factor Indices and S&P/BMV Single Factor Indices – Weighted Versions. Constituents removed from the S&P/BMV IPC Index and S&P/BMV IPC CompMx are removed from the indices simultaneously.

S&P/BMV Total Mexico ESG Index. Constituents removed from the S&P/BMV Total Mexico Index are removed from the index simultaneously. In addition, at the discretion of the Index Committee, a deletion may occur if an MSA is raised by SAM.

Stock Suspensions

For suspended stocks, the last available official closing price prior to the suspension is used for index calculation during the suspension period. Suspended stocks that exceed a threshold of 20 business days are reviewed for possible index deletion. Any deletion is made using a stock price of zero and with five days' advanced notice.

Investable Weight Factor (IWF)

All issues in the S&P/BMV Indices are assigned a float factor, called an Investable Weight Factor (IWF). The IWF ranges between 0 and 1 and is an adjustment factor that accounts for the publicly available shares of a company.

Please refer to S&P Dow Jones Indices' Float Adjustment Methodology for a detailed description of float adjustment and IWFs.

Shares. For more information on shares outstanding changes, please refer to *S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology*.

Rebalancing Share and IWF Data

For index selection purposes, all S&P/BMV Indices use shares outstanding and IWF figures as of the rebalancing effective date.

Liquidity Data

The daily traded value of each stock used in the liquidity screenings for all S&P/BMV indices is sourced from the BMV.

Other Adjustments

In cases where there is no achievable market price for a stock being deleted, it can be removed at a zero or minimal price at the Index Committee's discretion, in recognition of the constraints faced by investors in trading bankrupt or suspended stocks.

Currency of Calculation and Additional Index Return Series

The indices are calculated in Mexican pesos. In addition, the S&P/BMV IPC and S&P/BMV IRT indices are also available in U.S. dollars. Please refer to *Index Dissemination* for a list of indices and currency versions included in this methodology.

The Valmer U.S. dollar/Mexican peso spot rate, captured at 2:00 PM Mexico City time is used for end-of-day index calculation of the S&P/BMV China SX20 Index, S&P/BMV Mexico-Brazil Index, S&P/BMV Brazil 15 Index, S&P/BMV Ingenius Index, as well as for the U.S. dollar versions of the S&P/BMV IPC and S&P/BMV IRT indices.¹³

Intra-day real-time calculations use the mid spot rate provided by Refinitiv (MXN=).

In addition to the indices detailed in this methodology, additional return series versions of the indices may be available, including, but not limited to: currency, currency hedged, decrement, fair value, inverse, leveraged, and risk control versions. For a list of available indices, please refer to [S&P DJI's All Indices by Methodology Report](#).

For information on various index calculations, please refer to S&P Dow Jones Indices' Index Mathematics Methodology.

For the inputs necessary to calculate certain types of indices, including decrement, dynamic hedged, fair value, and risk control indices, please refer to the Parameters documents available at www.spdji.com.

¹³ For the U.S dollar version of the S&P/BMV IPC and S&P/BMV IRT indices, index history prior to 06/02/2017 used the mid spot rate provided by Refinitiv.

Base Dates and History Availability

Index history availability, base dates, and base values are shown in the table below.

Index	Launch Date	First Value Date	Base Date	Base Value
S&P/BMV Bursa Optimo Index	09/20/2013	03/30/2007	03/30/2007	100
S&P/BMV China SX20 Index	01/17/2010	12/31/2008	12/31/2008	100
S&P/BMV Dividend Index	10/30/2009	01/31/2007	01/31/2007	100
S&P/BMV FIBRAS Index	10/11/2011	10/11/2011	10/11/2011	100
S&P/BMV FIBRAS Index NTR	08/14/2020	02/06/2017	02/06/2017	100
S&P/BMV Housing Index	12/19/2005	12/31/1996	12/31/1996	100
S&P/BMV Consumer Discretionary Sector Index	12/31/1997	12/31/1997	12/31/1997	100
S&P/BMV Consumer Staples Sector Index	12/31/1997	12/31/1997	12/31/1997	100
S&P/BMV Financials Sector Index	12/31/1997	12/31/1997	12/31/1997	100
S&P/BMV Health Care Sector Index	12/31/1997	12/31/1997	12/31/1997	100
S&P/BMV Industrials Sector Index	12/31/1997	12/31/1997	12/31/1997	100
S&P/BMV Materials Sector Index	12/31/1997	12/31/1997	12/31/1997	100
S&P/BMV Telecommunication Services Sector Index	12/31/1997	12/31/1997	12/31/1997	100
S&P/BMV Commercial Services Index	01/31/2007	01/31/2007	01/31/2007	100
S&P/BMV Construction Index	03/05/2010	01/31/2007	01/31/2007	100
S&P/BMV Financial Services Index	01/31/2007	01/31/2007	01/31/2007	100
S&P/BMV Infrastructure & Transportation Index	03/05/2010	01/31/2007	01/31/2007	100
S&P/BMV Manufacturing, Electricity, & Water Index	01/31/2007	01/31/2007	01/31/2007	100
S&P/BMV Mining & Agriculture Index	01/31/2007	01/31/2007	01/31/2007	100
S&P/BMV Retail & Distributors Index	01/31/2007	01/31/2007	01/31/2007	100
S&P/BMV Consumer Staples Select Sector Index	10/30/2009	01/31/2007	12/31/2002	100
S&P/BMV Financials Select Sector Index	10/31/2006	12/31/2002	12/31/2002	100
S&P/BMV Industrials Select Sector Index	10/31/2006	12/31/2002	12/31/2002	100
S&P/BMV Materials Select Sector Index	10/31/2006	12/31/2002	12/31/2002	100
S&P/BMV IPC CompMx Index	10/16/2006	12/31/2004	12/31/2004	100

Index Data

Calculation Return Types

S&P Dow Jones Indices calculates multiple return types which vary based on the treatment of regular cash dividends. The classification of regular cash dividends is determined by S&P Dow Jones Indices.

- Price Return (PR) versions are calculated without adjustments for regular cash dividends.
- Gross Total Return (TR) versions reinvest regular cash dividends at the close on the ex-date without consideration for withholding taxes.
- Net Total Return (NTR) versions, if available, reinvest regular cash dividends at the close on the ex-date after the deduction of applicable withholding taxes.

In the event there are no regular cash dividends on the ex-date, the daily performance of all three indices will be identical.

For a complete list of indices available, please refer to the daily index levels file (“.SDL”).

For more information on the classification of regular versus special cash dividends as well as the tax rates used in the calculation of net return, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

For more information on the calculation of return types, please refer to S&P Dow Jones Indices' Index Mathematics Methodology.

Index Governance

Index Committee

The indices are maintained by the S&P/BMV Index Committee. All committee members are full-time employees of S&P Dow Jones Indices and the Bolsa Mexicana de Valores. The Index Committee meets regularly. At each meeting, the Index Committee may review pending corporate actions that may affect index constituents, statistics comparing the composition of the indices to the market, companies that are being considered as candidates for addition to an index, and any significant market events. In addition, the Index Committee may revise index policy covering rules for selecting companies, treatment of dividends, share counts or other matters.

S&P Dow Jones Indices considers information about changes to its indices and related matters to be potentially market moving and material. Therefore, all Index Committee discussions are confidential.

S&P Dow Jones Indices' Index Committees reserve the right to make exceptions when applying the methodology if the need arises. In any scenario where the treatment differs from the general rules stated in this document or supplemental documents, clients will receive sufficient notice, whenever possible.

In addition to the daily governance of indices and maintenance of index methodologies, at least once within any 12-month period, the Index Committee reviews the methodology to ensure the indices continue to achieve the stated objectives, and that the data and methodology remain effective. In certain instances, S&P Dow Jones Indices may publish a consultation inviting comments from external parties.

For information on Quality Assurance and Internal Reviews of Methodology, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Index Policy

Announcements

All index constituents are evaluated daily for data needed to calculate index levels and returns. All events affecting the daily index calculation are typically announced in advance via the Index Corporate Events report (SDE), delivered daily to all clients. Any unusual treatment of a corporate action or short notice of an event may be communicated via email to clients.

For more information, please refer to the Announcements section of S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Pro-forma Files

In addition to the corporate events file (.SDE), S&P Dow Jones Indices provides constituent pro-forma files each time the indices rebalance. The pro-forma0 file is typically provided daily in advance of the rebalancing date and contains all constituents and their corresponding weights and index shares effective for the upcoming rebalancing. Since index shares are assigned based on reference prices prior to the rebalancing, the actual weight of each stock at the rebalancing differs from these weights due to market movements.

Please visit www.spdji.com for a complete schedule of rebalancing timelines and pro-forma delivery times.

Holiday Schedule

The indices are calculated all business days of the year, provided the BMV is open.

A complete holiday schedule for the year is available at www.spdji.com.

Rebalancing

The Index Committee may change the date of a given rebalancing for reasons including market holidays occurring on or around the scheduled rebalancing date. Any such change will be announced with proper advance notice where possible.

Index Closing Times

The indices follow the standard BMV Exchange closing time.

Unexpected Exchange Closures

For information on Unexpected Exchange Closures, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Recalculation Policy

For information on the recalculation policy, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Real-Time Calculation

Real-time, intra-day, index calculations are executed for certain indices, whenever the BMV is open. Real-time indices are not restated.

For information on Calculations and Pricing Disruptions, Expert Judgment and Data Hierarchy, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Contact Information

For questions regarding an index, please contact: index_services@spglobal.com.

Index Dissemination

Index levels are available through S&P Dow Jones Indices' Web site at www.spdji.com, major quote vendors (see codes below), numerous investment-oriented Web sites, and various print and electronic media.

Tickers

The table below lists headline indices covered by this document. All versions of the below indices that may exist are also covered by this document. Please refer to [S&P DJI's All Indices by Methodology Report](#) for a complete list of indices covered by this document.

Appendix II – Quality Score

Fundamental Ratios Calculation

The first step to determine the overall quality score is to calculate, as of the rebalancing reference date, the three fundamental ratios below for each security in the index universe. They are defined as follows:

- **Operating ROA.** This is calculated as a company's trailing 12-month operating income divided by the latest reported total assets of the company:

- a. For all stocks:

$$\text{Operating ROA} = \frac{EBIT}{\text{Total Assets}}$$

where *EBIT* is defined as the 12-month trailing Operating Income as follows Net Sales or Revenue minus Cost of Goods Sold, Selling, General & Administrative Expenses and Other Operating Expenses.

- b. For those stocks for which EBIT is unavailable: :

$$\text{Operating ROA} = \frac{\text{Net Interest Income}}{\text{Total Assets}}$$

Where 12-month trailing Net Interest Income Represents the difference between the total interest income and total interest expense of the bank.

- **Accruals Ratio.** This is computed using the change of a company's net operating assets over the last year divided by its average net operating assets over the last two years:

$$\text{Accruals Ratio} = \frac{(NOA_t - NOA_{t-1})}{(NOA_t + NOA_{t-1})/2}$$

- **Financial Leverage Ratio.** This is calculated as a company's latest total debt divided by its book value.

$$\text{Leverage} = \frac{\text{Total Debt}}{(\text{BVPS} \times \text{Common Shares Outstanding})}$$

Outlier Handling and Winsorization

- **Operating ROA and Accruals Ratio.** For a given fundamental variable, the values for all securities are first ranked in ascending order. Then, for securities that lie above the 95 percentile rank or below the 5 percentile rank, their value is set as equal to the value of the 95 percentile ranked or the 5 percentile ranked security, whichever is applicable.
- **Financial Leverage Ratio.** The values for all securities are first ranked in ascending order. Then, for securities that lie above the 95 percentile rank or below the 5 percentile rank, their value is set as equal to the value of the 95 percentile ranked or the 5 percentile ranked security, whichever is applicable. If the underlying data point for a given stock's BVPS is negative, leading to a negative Leverage, its Leverage value will be excluded and the stock will be assigned a Leverage Z-score set as equal to the Leverage Z-score value of the 5 percentile ranked security.

Z-score & Quality Score Computation

Z-score Computation. Computing a z-score is a widely adopted method of standardizing a variable in order to combine it with other variables that may have a different scale or unit of measurement. After winsorizing all the three fundamental ratios, the z-score for each of the three ratios for each security is

calculated using the mean and standard deviation of the relevant variable within each of the index universes.

- **Operating ROA.** The z-score is calculated as follows:

$$z_{\alpha} = (x_{\alpha} - \mu_{\alpha}) / \sigma_{\alpha}$$

- **Accruals and Financial Leverage Ratios.** The z-score is calculated as follows:

$$z_{\alpha} = - (x_{\alpha} - \mu_{\alpha}) / \sigma_{\alpha}$$

where:

z_{α} = z-score for a given security.

x_{α} = Winsorized variable for a given security.

μ_{α} = Arithmetic mean of the winsorized variable in the index universe, excluding any missing values.

σ_{α} = Standard deviation of the winsorized variable in the index universe.

Average Quality Z-score Computation. For each security, the average z-score is computed by taking a simple average of the three scores. Where there is a missing value, the average z-score is computed by taking a simple average of the remaining two scores. A security must have at least one z-score for it to be included in the index.

Adjusted Quality Score

If $Z > 0$, Score = $1 + Z$

If $Z < 0$, Score = $(1 / (1 - Z))$

If $Z = 0$, Score = 1

Appendix III – Value Score

Fundamental Ratios Calculation

The first step to determine the overall value score is to calculate, as of the rebalancing reference date, the two fundamental ratios below for each security in the index universe. They are defined as follows:

- **Operating Income to Enterprise Value.** This calculation is measured by taking a company's 12-month trailing operating EBIT or 12-month trailing Net Interest income for banks divided by the company's latest Enterprise Value (EV). EV is a measure of a company's total value.

- a. For all stocks: Operating Income to EV is calculated as a company's trailing 12-month Operating EBIT divided by the company's latest EV:

$$\text{Operating Income to Enterprise Value} = \frac{EBIT}{EV}$$

$$EV = \text{market value of common stock} + \text{market value of preferred equity} + \text{market value of debt} + \text{minority interest} - \text{cash and investments}$$

- b. For those stocks for which EBIT is unavailable: Operating Income to EV is calculated as a company's trailing 12-month Net Interest Income divided by company's latest EV:

$$\text{Operating Income to EV} = \frac{\text{Net Interest Income}}{EV}$$

- **Book Value to Price Ratio.** This is calculated as a company's latest book value per share divided by its price:

$$\text{Book Value to Price} = \frac{BVPS}{P}$$

Outlier Handling and Winsorization

For a given fundamental variable, the values for all securities are first ranked in ascending order. Then, for securities that lie above the 95 percentile rank or below the 5 percentile rank, their value is set as equal to the value of the 95 percentile ranked or the 5 percentile ranked security, whichever is applicable.

Z-score & Value Score Computation

Z-score Computation. Computing a z-score is a widely adopted method of standardizing a variable in order to combine it with other variables that may have a different scale or unit of measurement. After winsorizing all the three fundamental ratios, the z-score for each of the three ratios for each security is calculated using the mean and standard deviation of the relevant variable within the index universe.

The z-score is calculated as follows:

$$z_{\alpha} = (x_{\alpha} - \mu_{\alpha}) / \sigma_{\alpha}$$

where:

z_{α} = Z-score for a given security.

x_{α} = Winsorized variable for a given security.

μ_{α} = Arithmetic mean of the winsorized variable in the index universe, excluding any missing values.

σ_{α} = Standard deviation of the winsorized variable in the index universe.

Average Z-score Computation. For each security, the average z-score is computed by taking a simple average of the two scores. A security must have at least one z-score for it to compute the Value z-score.

Adjusted Value Score

If $Z > 0$, Score = $1 + Z$

If $Z < 0$, Score = $(1 / (1 - Z))$

If $Z = 0$, Score = 1

Appendix IV – Growth Score

Growth Value Calculation

Growth value is calculated for each of the securities in the index universe on each of the rebalancing reference dates. The growth value is determined as follows:

1. **Price Momentum.** The momentum value is computed as the 12-month price change, excluding the most recent month of the security in local currency. If 12 months of price history is not available, momentum value is calculated from nine months of price history. The effective rebalancing month is stated as month (M).

- a. Momentum Value = $\left[\frac{price_{M-2}}{price_{M-14}} \right] - 1$

- b. Or, Momentum Value = $\left[\frac{price_{M-2}}{price_{M-11}} \right] - 1$ if 12 months of price history is not available.

2. The Momentum value is further adjusted by the security's volatility to arrive at risk-adjusted Price momentum value.

$$\text{Risk-Adjusted Momentum Value} = \text{Momentum Value}_i / \sigma_i$$

where:

σ = Standard deviation of daily price returns for the same date period used in Step 1 above.

- **3 Year Operating EBIT Growth.** (For Banks 3 Year Net interest income Growth).

- a. For stocks not classified as part of the Banks industry group (GICS code: 4010), then 3 Year Operating Income Growth is defined as a company's trailing 12-month EBIT divided by the 12-month EBIT as 3 years (36 months before) minus one.

$$\text{3Y Operating Income Growth} = \left[\frac{EBIT_Y}{EBIT_{Y-3}} \right] - 1$$

- b. For stocks classified as part of the Banks industry group then 3 year operating Income growth is defined as a company's trailing 12-month Net Interest Income divided by the 12-month Net as 3 years before (36 months before)

$$\begin{aligned} \text{3Y Operating Income Growth} \\ = \left[\frac{\text{Net Interest Income}_Y}{\text{Net Interest Income}_{Y-3}} \right] - 1 \end{aligned}$$

- **3 Year Sales Per Share Growth Rate.** Latest company's trailing 12-month Sales per Share divided by company's 12-month Sales per Share as of 3 years ago (36 months before), minus one:

$$\text{3Y Sales per Share Growth} = \left[\frac{\text{Sales_PS}_Y}{\text{Sales_PS}_{Y-3}} \right] - 1$$

Outlier Handling and Winsorization

For a given fundamental variable, the values for all securities are first ranked in ascending order. Then, for securities that lie above the 95 percentile rank or below the 5 percentile rank, their value is set as equal to the value of the 95 percentile ranked or the 5 percentile ranked security, whichever is applicable.

Z-score & Growth Score Computation

Z-score Computation. Computing a z-score is a widely adopted method of standardizing a variable. The z-score for risk-adjusted momentum value for each security is calculated using the mean and standard deviation of the relevant variable within the index universe.

The z-score is calculated as follows:

$$z_{\alpha} = (x_{\alpha} - \mu_{\alpha}) / \sigma_{\alpha}$$

where:

z_{α} = Z-score for a given security.

x_{α} = Winsorized variable for a given security.

μ_{α} = Arithmetic mean of the winsorized variable in the index universe, excluding any missing values.

σ_{α} = Standard deviation of the winsorized variable in the index universe.

Average Growth z-score Computation. For each security, the average z-score is computed by taking a simple average of the three scores. Where there is a missing value, the average z-score is computed by taking a simple average of the remaining two scores. A security must have at least one z-score for it to be included in the index.

Adjusted Growth Score

If $Z > 0$, Score = $1 + Z$

If $Z < 0$, Score = $(1 / (1 - Z))$

If $Z = 0$, Score = 1

Appendix V – Enhanced Value Score

Fundamental Ratios Calculation

The first step to determine the overall value score is to calculate, as of the rebalancing reference date, the three fundamental ratios below for each security in the index universe. They are defined as follows:

- **Operating Income to Enterprise Value.** This calculation is measured by taking a company's 12-month trailing operating EBIT or 12-month trailing Net Interest income for banks divided by the company's latest Enterprise Value (EV). EV is a measure of a company's total value.

- a. For all stocks Operating Income to EV is calculated as a company's trailing 12-month Operating EBIT divided by the company's latest EV:

$$\text{Operating Income to Enterprise Value} = \frac{EBIT}{EV}$$

$$EV = \text{market value of common stock} + \text{market value of preferred equity} + \text{market value of debt} + \text{minority interest} - \text{cash and investments}$$

- b. For stocks for which EBIT is unavailable then Operating Income to EV is calculated as a company's trailing 12-month Net Interest Income divided by company's latest EV:

$$\text{Operating Income to EV} = \frac{\text{Net Interest Income}}{EV}$$

- **Book Value to Price Ratio.** This is calculated as a company's latest book value per share divided by its price:

$$\text{Book Value to Price} = \frac{BVPS}{P}$$

- **Sales-to-price Ratio.** This is calculated as a company's trailing 12-month sales per share divided by its price:

$$\text{Sales to Price} = \frac{SPS}{P}$$

Outlier Handling and Winsorization

For a given fundamental variable, the values for all securities are first ranked in ascending order. Then, for securities that lie above the 95 percentile rank or below the 5 percentile rank, their value is set as equal to the value of the 95 percentile ranked or the 5 percentile ranked security, whichever is applicable.

Z-score & Value Score Computation

Z-score Computation. Computing a z-score is a widely adopted method of standardizing a variable in order to combine it with other variables that may have a different scale or unit of measurement. After winsorizing all the three fundamental ratios, the z-score for each of the three ratios for each security is calculated using the mean and standard deviation of the relevant variable within the index universe. The z-score is calculated as follows:

$$z_{\alpha} = (x_{\alpha} - \mu_{\alpha}) / \sigma_{\alpha}$$

where:

$$z_{\alpha} = \text{Z-score for a given security.}$$

x_α = Winsorized variable for a given security.

μ_α = Arithmetic mean of the winsorized variable in the index universe, excluding any missing values.

σ_α = Standard deviation of the winsorized variable in the index universe.

Average Z-score Computation. For each security, the average z-score is computed by taking a simple average of the three scores. Where there is a missing value, the average z-score is computed by taking a simple average of the remaining two scores. A security must have at least one z-score for it to be included in the index.

Outlier Handling and Winsorization. Outlier average z-scores are winsorized to ensure that the average values used to calculate the overall value score are less distorted by extreme values. To do this, for a given average z-score, the values for all securities are first ranked in ascending order. Then, for securities that lie above 4 or below -4, their value is set as equal to 4 or -4, whichever is applicable.

Value Score Computation. Using the winsorized average z-scores for the three value factors, a value score is computed for each of the securities. For a given security, if its winsorized average z-score is above 0, then its value score will be the addition of 1 and the average z-score. On the other hand, if its winsorized average score is below 0, then its value score will be the result of the reciprocal of 1 subtracted by its average z-score.

If average $Z > 0$, Value Score = $1 + Z$

If average $Z < 0$, Value Score = $(1 / (1 - Z))$

If average $Z = 0$, Value Score = 1

Appendix VI – Momentum and Short-Term Momentum Score

Momentum Value Calculation

Momentum Value is calculated for each of the securities in the index universe on each of the rebalancing reference dates. The momentum value is determined as follows:

1. The momentum value is computed as the 12-month price change, excluding the most recent month of the security in local currency. If 12 months of price history is not available, momentum value is calculated from nine months of price history. The effective rebalancing month is stated as month (M).

- a. Momentum Value

$$\text{Momentum Value} = \left(\text{price}_{M-2} / \text{price}_{M-14} \right) - 1$$

- b. Or, Momentum Value if 12 months of price history is not available.

$$\text{Momentum Value} = \left(\text{price}_{M-2} / \text{price}_{M-11} \right) - 1$$

2. The momentum value is further adjusted by the security's volatility to arrive at risk-adjusted momentum value.

Risk-Adjusted Momentum Value = Momentum Value / σ

where:

σ = Standard deviation of daily price returns for the same date period used in Step 1 above.

NOTE: If there is no price available on day M-2 or day M-14, the price from the day prior will be used. If there is no price available on any of the ten days prior, the momentum value will be calculated using formula (b) above.

Short-Term Momentum Value

Short-term momentum value is calculated for each of the securities in the index universe on each of the rebalancing reference dates. The momentum value is determined as follows:

1. The momentum value is computed as the 6-month price change, excluding the most recent month of the security in local currency. If six months of price history is not available, momentum value is calculated from three months of price history. The effective rebalancing month is stated as month (M).

- a. Momentum Value

$$\text{Momentum Value} = \left(\text{price}_{M-2} / \text{price}_{M-8} \right) - 1$$

- b. Or, Momentum Value if six months of price history is not available.

$$\text{Momentum Value} = \left(\text{price}_{M-2} / \text{price}_{M-5} \right) - 1$$

2. The momentum value is further adjusted by the security's volatility to arrive at risk-adjusted momentum value.

$$\text{Risk-Adjusted Momentum Value} = \text{MomentumValue}_i / \sigma_i$$

where: σ = Standard deviation of daily price returns for the same date period used in Step 1 above.

NOTE: If there is no price available on day $M-2$ or day $M-8$, the price from the day prior will be used. If there is no price available on any of the ten days prior, the momentum value will be calculated using formula (b) above. If the same condition exists for formula (b), the stock is excluded from the S&P /BMV IPC CompMx Short-Term Momentum and S&P /BMV IPC CompMx Short-Term Momentum Weighted indices.

Z-score Computation

Computing a z-score is a widely adopted method of standardizing a variable in order to combine it with other variables that may have a different scale or unit of measurement. The z-score for each security is calculated using the mean and standard deviation of the relevant variable within the index universe.

The z-score is calculated as follows: $z_\alpha = (x_\alpha - \mu_\alpha) / \sigma_\alpha$

where:

z_α = Z-score for a given security.

x_α = Observed value for a given security.

μ_α = Arithmetic mean of the variable in the index universe, excluding any missing values.

σ_α = Standard deviation of the variable in the index universe.

Winsorization reduces the impact of outliers on a data set by limiting them to a designated value or score. For the S&P/BMV Momentum Indices, the winsorized z-score of a security is capped at ± 3 .

Momentum Score Computation. Using the winsorized z-scores, a momentum score is computed for each of the securities. For a given security, if its winsorized z-score is above 0, then its momentum score will be the addition of 1 and the z-score. On the other hand, if its winsorized z-score is below 0, then its momentum score will be the result of the inverse of 1 subtracted by its z-score.

Momentum Score

If $Z > 0$, Momentum Score = $1 + Z$

If $Z < 0$, Momentum Score = $(1 / (1 - Z))$

If $Z = 0$, Momentum Score = 1

Appendix VII – Volatility

Volatility Calculation

Volatility is defined as the standard deviation of the security's daily price returns in local currency over the prior one year of trading days. It can be mathematically expressed as:

$$\sqrt{\frac{\sum_{i=1}^N (X_i - \bar{X})^2}{N - 1}}$$

where:

$$X_i = \text{Price Change} = \frac{P_t}{P_{t-1}} - 1$$

P_t = Closing price of the stock on day t

P_{t-1} = Closing price of the stock on day $t - 1$

$t = 1$ to N

\bar{X} = Average price change

N = Number of trading days in a year based on local calendar

Appendix VIII – Media & Stakeholder Analysis

Media & Stakeholder Analysis

The Media & Stakeholder Analysis (MSA) forms an integral part of the SAM Corporate Sustainability Assessment. MSA enables SAM to monitor companies' sustainability performance on an ongoing basis, by assessing current controversies with potentially negative reputational or financial impacts. SAM monitors news coverage of assessed companies on a daily basis using news stories from the media and stakeholder groups compiled and pre-screened by RepRisk. RepRisk is leading business intelligence provider specializing in environmental, social and governance issues. News stories covered by the MSA include a range of issues. These include issues such as economic crime or corruption, fraud, illegal commercial practices, human rights issues, labor disputes, workplace safety, catastrophic accidents or environmental violations.

Each indicator is linked to a specific criteria in the SAM CSA. Each MSA Case has a score and works as a multiplier to the corresponding Criteria score: no MSA cases mean that the company gets full score for that Criteria, while an MSA case reduces the score of the company in the Criteria by a specific percentage. Multiple cases corresponding to the same Criteria for a single company may have a significantly higher impact than a single case, as the multiplication factors are summed up. More information on the MSA methodology can be found in the [MSA Methodology Guidebook](#).

For more information on RepRisk, please refer to www.reprisk.com. This service is not considered a direct contribution to the index construction process

Appendix IX – Methodology Changes

Methodology Changes

Methodology changes since November 1, 2016 are as follows:

Index	Change	Effective Date (After Close)	Previous	Methodology Updated
All S&P/BMV Equity Indices	Treatment of Spin-Offs	12/11/2020	A spun-off entity is added to all indices of which the parent is a constituent, at a zero price at the market close of the day before the ex-date. There is no divisor change. All key attributes of the spun-off company are the same as the parent's at the time of addition. For more information please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices document.	<p>Except for the indices detailed below, a spin-off is added to all indices of which the parent is a constituent at a zero price at the market close of the day before the ex-date. There is no divisor change. All key attributes of the spin-off are the same as the parent's at the time of addition. The spin-off remains in the index and is evaluated for continued inclusion at the subsequent reconstitution.</p> <p>For the following indices, the spin-off is added to the index at a zero price and is dropped from the index after the first day of regular way trading, provided the drop event has been announced at least two days prior to the drop date:</p> <ul style="list-style-type: none"> • S&P/BMV Bursa Optimo Index • S&P/BMV Dividend Index • S&P/BMV Ingenius Index • S&P/BMV IPC Quality, Value, and Growth Index • S&P/BMV Single Factor Indices • S&P/BMV Single Factor Indices – Weighted Versions • S&P/BMV Total Mexico ESG
S&P/BMV Housing Index	Trading History	09/20/2019	Stocks must not have 10 or more non-trading days over the prior three-month period as of the rebalancing reference date.	Stocks must have a trading history of at least three months. In addition, stocks must have traded on at least 80% of the available trading days over the prior 12-month period as of the rebalancing reference date. For stocks with less than 12 months of trading history (e.g. initial public offerings), the threshold is applied to the available trading history.
S&P/BMV Economic Activity Indices S&P/BMV Investable Select Sector Indices	Trading History	09/20/2019	Stocks must not have five or more non-trading days over the prior three-month period as of the rebalancing reference date.	Stocks must have a trading history of at least three months. In addition, stocks must have traded on at least 80% of the available trading days over the prior 12-month period as of the rebalancing reference date. For stocks with less than 12 months of trading history (e.g. initial public offerings), the threshold is applied to the available trading history.
S&P/BMV IPC Quality, Value & Growth Index	Name change	03/29/2019	The index name was S&P/BMV Quality, Value & Growth Index.	The index name is S&P/BMV IPC Quality, Value & Growth Index.
S&P/BMV FIBRAS Index	Weighting Scheme	06/21/2019	The index is weighted based on each stock's value traded, subject to a single stock weight limit of 25%.	<p>The index is weighted by float-adjusted market capitalization, subject to the following constraints:</p> <ul style="list-style-type: none"> • No single stock's weight can exceed 25%.

				<ul style="list-style-type: none"> The aggregate weight of stocks with weights greater than 15% cannot exceed 60%. The weight of any individual stock is restricted to a maximum liquidity weight calculated as each stock's six-month MDVT divided by the sum of the six-month MDVT for all stocks in the index, multiplied by three. Note that the capping algorithm redistributes the excess weight to the other stocks in proportion to their initial weights. Where the capping algorithm fails, the liquidity weight cap is relaxed by 0.5 in each iteration until a solution is found.
All S&P/BMV Indices	Float factors	09/21/2018	<p>For Mexico-domiciled companies whose primary exchange is the BMV, S&P Dow Jones Indices leverages the annual float factors published by the BMV as the basis for the September annual review of IWFs. Adjustments to Mexican stock IWFs outside of the September annual review are made as needed using the methodology described in S&P Dow Jones Indices' Float Adjustment Methodology. For more information on the BMV's float methodology, please refer to the BMV's Equity Indices Float-adjusted Shares Outstanding methodology available at www.bmv.com.mx/docs-pub/INDICES/CTEN_INOT/BMV_Equity_Indices_Float_adjusted_Shares_Outstanding.pdf. Based on differences in the S&P Dow Jones Indices and BMV float methodologies, the IWF used in the S&P/BMV Indices may differ from the standard IWF used in S&P- and Dow Jones- branded indices. In the event BMV is unable to provide float information for a security listed on its exchange and included in an S&P/BMV index, S&P Dow Jones Indices will use its standard IWF.</p> <p>For the international listings in the S&P/BMV China SX20, S&P/BMV Mexico-Brazil and S&P/BMV Brazil 15 Indices, S&P Dow Jones Indices will use its standard IWF. For information on S&P Dow Jones Indices standard IWF, please refer to S&P Dow Jones Indices' Float Adjustment Methodology.</p>	<p>All issues in the S&P/BMV Indices are assigned a float factor, called an Investable Weight Factor (IWF). The IWF ranges between 0 and 1 and is an adjustment factor that accounts for the publicly available shares of a company.</p> <p><i>Please refer to S&P Dow Jones Indices' Float Adjustment Methodology for a detailed description of float adjustment and IWFs.</i></p>
S&P IPC CompMx Index	Liquidity Criteria	06/15/2018	<p>Stocks must have a monthly median traded value ratio (MTVR) of at least 1% over the prior three-month and 12-month periods.</p> <p>Stocks with a MTVR of less than 1%, but greater than 0.5% over the prior three-month and 12-month periods, must have an average daily value traded (ADVT) of at least MXN 10 million over the prior three-month period.</p> <p>Current index constituents remain eligible if they have a MTVR of at least 0.5% over the prior three-month and 12-month periods.</p>	<p>Stocks must have a MTVR of at least 1% over the prior three-month and 12-month periods, and a median daily value traded (MDVT) of at least MXN 4 million over the prior three-month period.</p> <p>Current index constituents remain eligible if they have a MTVR of at least 0.5% over the prior three-month and 12-month periods, and a MDVT of at least MXN 2 million over the prior three-month period.</p>
S&P/BMV IPC LargeCap, MidCap, and SmallCap	Constituent Selection	06/15/2018	<p>Size segments are based on the cumulative market capitalization within the S&P/BMV IPC CompMx. Companies are ranked by total market capitalization, and then total company market capitalization is accumulated to 75% forming the S&P/BMV IPC LargeCap, the next 20% forming the S&P/BMV IPC MidCap, and the final 5% forming the S&P/BMV IPC SmallCap.</p>	<p>Size segments are based on the cumulative market capitalization within the S&P/BMV IPC CompMx. Companies are ranked by total market capitalization, and then float-adjusted market capitalization at the stock level is accumulated to 75% forming the S&P/BMV IPC LargeCap, the next 20% forming the S&P/BMV IPC MidCap, and the final 5% forming the S&P/BMV IPC SmallCap.</p>
S&P/BMV IPC LargeCap, MidCap, and SmallCap	Constituent Weightings	06/15/2018	<p>Each index is weighted based on float-adjusted market capitalization, subject to the following constraints:</p> <ul style="list-style-type: none"> No single stock's weight can exceed 25%. 	<p>Each index is weighted based on float-adjusted market capitalization, subject to the following constraints:</p> <ul style="list-style-type: none"> No single stock's weight can exceed 25%.

			<ul style="list-style-type: none"> The aggregate weight of the five largest stocks cannot exceed 60%. Basket liquidity is applied to each index using a portfolio size of MXN 200 million to be turned over in one business day at 100% of its six-month MDVT. The index committee reserves the right to change the portfolio size if market conditions or other factors require it. 	<ul style="list-style-type: none"> The aggregate weight of the five largest stocks cannot exceed 60%. The weight of any individual stock is restricted to a maximum weight calculated as each stock's six-month MDVT divided by the sum of the six-month MDVT for all stocks in the index, multiplied by two. If a stock's float adjusted market capitalization weight exceeds the maximum weight, then that stock will be capped at its maximum weight and the excess weight will be redistributed proportionately to the remaining stocks that have not been capped.
S&P/BMV Brazil 15, China SX20, and Mexico-Brazil Indices	Rebalancing Schedule	06/15/2018	The index is rebalanced semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.	Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. In addition, the index is reweighted outside of the semi-annual reconstitutions, effective after the market close on the third Friday of June and December. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.
S&P IPC CompMx Index	Rebalancing Schedule	06/15/2018	The index is rebalanced semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of April and October, respectively. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.	Index composition is reconstituted semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of April and October, respectively. In addition, the index is reweighted outside of the semi-annual reconstitutions, effective after the market close on the third Friday of March and September. Index shares are calculated using closing prices seven business days prior to the rebalancing effective date.
S&P/BMV Housing Index	Liquidity	09/15/2017	Stocks must be categorized in the high or medium liquidity tiers, based on Marketability Scores from two months prior to the rebalancing date.	Stocks must be categorized in the high, medium or low liquidity tiers, based on Marketability Scores from two months prior to the rebalancing date.
S&P/BMV Housing Index	Trading History	09/15/2017	Stocks with five or more non-trading days over the three-month period prior to the rebalancing reference date are ineligible.	Stocks with 10 or more non-trading days over the three-month period prior to the rebalancing reference date are ineligible.
S&P/BMV Brazil 15, China SX20, and Mexico-Brazil Indices	Constituent Selection and Constituent Weighting	09/15/2017	The indices use total market capitalization for both component selection and weighting. BMV assigns a float of 1 to all international listings.	The indices use float-adjusted market capitalization for both component selection and weighting following S&P DJI's standard float methodology for international listings only. Domestic listings in the S&P/BMV Mexico-Brazil Index continue to use the BMV float methodology.
S&P/BMV IPC CompMx, Brazil 15, China SX20, and Mexico-Brazil Indices	Shares and Float changes	09/15/2017	The indices follow S&P Dow Jones Indices' Non-Market Capitalization Weighted methodology for index calculation purposes. Intra-rebalance changes to a constituent's shares outstanding or IWF have no effect on index weights and do not cause a divisor adjustment.	The indices follow S&P Dow Jones Indices' Float-Adjusted Market Capitalization corporate action treatment. Intra-rebalance changes to a constituent's shares outstanding or IWF will impact the total index market capitalization and cause a divisor adjustment.
All S&P/BMV Indices	Shares Change Implementation	09/15/2017	The indices used BMV share counts.	The indices use share counts as determined by S&P Dow Jones Indices.
All S&P/BMV Indices	Float factors	09/15/2017	<p>Float factors are rounded up to the next 5% if higher than 15%. If higher than 12% but lower than 15%, float factors are kept unchanged. If lower than 12%, float factors are given a value of 0 unless the stock has a float-adjusted market cap of at least MXN 10,000 million, in which case it will use the actual float factor.</p> <p>Float factor changes that result from the annual float review were implemented starting in June.</p>	<p>Float factors are rounded to the nearest one percentage point in order to better represent the float-adjusted market capitalization of each company.</p> <p>Any float factor changes that result from the annual float review are implemented with the September rebalancing.</p>
S&P/BMV IPC Index	Market Capitalization	09/15/2017	Stock series will be eligible if they have a floating Market cap, computed using the volume weighted average Price of the last three months previous to the constituents	The Volume Weighted Average Price (VWAP) float-adjusted market capitalization must be at least MXN 10 billion (MXN 8 billion for current constituents).

			review, is at least 0.1% of the total index market cap.	
S&P/BMV IPC Index	Minimum IWF	09/15/2017	Stocks must have an IWF of at least 12%, except for stocks with a float-adjusted market cap of at MXN 10 billion.	Stocks must have an IWF of at least 0.10.
S&P/BMV IPC Index	Trading History	09/15/2017	Companies with 5 or more non-trading days over the three-month period prior to the rebalancing reference date are ineligible.	As of the rebalancing reference date: <ul style="list-style-type: none"> • Stocks must have a trading history of at least three months. • Stocks must have traded on at least 95% of the available trading days over the prior six-month period. • For stocks with less than six months of trading history (e.g. initial public offerings), the 95% threshold is applied to the available trading history.
S&P/BMV IPC Index	Multiple Share Classes	09/15/2017	If a company has multiple share classes, the most liquid share class, as of the rebalancing reference date, based on Marketability Scores, is considered for index inclusion.	If a company has multiple share classes, the most liquid share class, as of the rebalancing reference date, based on the MTVR over the prior six-month period is considered for index inclusion.
S&P/BMV IPC Index	Constituent Selection	09/15/2017	<p>Eligible stocks are ranked by the Turnover Factor, calculated as follows:</p> <ol style="list-style-type: none"> 1. Calculate the median share volume (Subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations) for each month, for the trailing 12 months leading up to the rebalance reference date. 2. Divide each of the monthly median share volume figures by the float-adjusted shares outstanding. The float-adjusted shares outstanding are as of the same date that is used for the median share volume. For example, if the median share volume for a given stock is from the 15th of the month, the float-adjusted shares outstanding are also as of the 15th of that same month. This is the monthly turnover ratio. 3. Determine the median of the available monthly turnover ratios from Step 2. Stocks with less than three months of trading history are ineligible. 4. Calculate the 12 month value traded by taking each stock's daily price multiplied by its share volume, and aggregated over a 12 month period (Subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations). If a stock has less than 12 months of trading history, its aggregate value traded is annualized. 5. Multiply the median monthly turnover ratio from Step 3 by the aggregate 12 month value traded from Step 4. Divide by the aggregate 12 month value traded for all eligible stocks. This is the stock's turnover factor. <p>The 55 stocks with the largest turnover factors are then ranked by each of the following factors:</p> <ol style="list-style-type: none"> 1. Turnover Factor 2. VWAP Float-Adjusted Market Capitalization for the last 12 months. 3. Value Traded, represented as the median of the monthly medians of value traded for the last 12 months. The monthly median value traded is defined as the median of all the daily value traded (Subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the 	<p>All stocks in the Selection Universe are evaluated based on the following liquidity criteria using data as of the rebalancing reference date:</p> <ul style="list-style-type: none"> • Stocks must have a median daily value traded (MDVT) of at least MXN 50 million (MXN 30 million for current constituents) over the prior three-month and six-month periods. • Stocks must have an annualized median traded value ratio (MTVR) of at least 25% over the prior three-month and six-month periods. • Current index constituents remain eligible if they have an annualized MTVR of at least 15% over the prior three-month and six-month periods. <p>If there are more than 35 eligible stocks, then the eligible stocks are ranked, in descending order, based on a combined ranking of VWAP float-adjusted market capitalization and six-month MDVT. The stocks with the greatest rankings are excluded until the constituent count reaches 35.</p> <p>If there are less than 35 eligible stocks, then stocks in the Selection Universe not meeting the constituent selection liquidity criteria are ranked, in descending order, based on a combined ranking of VWAP float-adjusted market capitalization and six-month MDVT. The stocks with the smallest rankings are added to the index until the constituent count reaches 35.</p> <p>In cases where two or more stocks have the same combined ranking, the most liquid stock based on MDVT is selected.</p>

			<p>average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations) for a given stock in a given month. The value traded is calculated by multiplying the number of shares traded by each stock's price.</p> <p>After ranking has been assigned for all the eligible stocks for each of the above factors, a joint rating is calculated for each stock by adding up the three rankings. The 35 stocks with the smallest joint ratings are selected for index inclusion.</p> <p>In cases where two or more stocks have the same joint rating, the stock with the highest VWAP float-adjusted market capitalization is selected.</p>	
S&P/BMV IPC Index	Pro-forma Schedule and Pricing Reference Dates	09/15/2017	<p>Pro-forma files are typically provided 10 business days in advance of the rebalancing date.</p> <p>The preliminary index shares are calculated using closing prices from 10 business days prior to the rebalancing date.</p> <p>The final index shares are provided as of the close of trading two business days prior to the rebalancing date and are calculated using closing prices from two business days prior to the rebalancing date.</p>	<p>Pro-forma files are provided 10 business days prior to the March and September rebalancing date. Pro-forma files are provided five business days prior to the June and December reweighting effective date.</p> <p>Index shares are calculated using closing prices 12 business days prior to the March and September rebalancing effective date and seven business days prior to the June and December reweighting effective date.</p>
S&P/BMV INMEX	Constituent Selection	09/15/2017	<p>Stocks meeting the eligibility criteria are ranked by the Turnover Factor, calculated as follows:</p> <ol style="list-style-type: none"> 1. Calculate the median share volume (Subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations) for each month, for the trailing 12 months leading up to the rebalance reference date. 2. Divide each of the monthly median share volume figures by the float-adjusted shares outstanding. The float-adjusted shares outstanding are as of the same date used for the median share volume. For example, if the median share volume for a given stock is from the 15th of the month, the float-adjusted shares outstanding are also as of the 15th of that same month. This becomes the monthly turnover ratio. 3. Determine the median of the available monthly turnover ratios from Step 2. Stocks with less than three months of trading history are ineligible. 4. Calculate the 12 month value traded by taking each stock's daily price multiplied by its share volume, and aggregated over a 12 month period (Subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations). If a stock has less than 12 months of trading history, its aggregate value traded will be annualized. 5. Multiply the median monthly turnover ratio from Step 3 by the aggregate 12 month value traded from Step 4. Divide by the aggregate 12 month value traded for all stocks that fulfill the eligibility criteria described in the Eligibility Factors section above. This is the stock's turnover factor. <p>The 55 stocks with the largest turnover factors are then ranked by each of the following factors.</p> <ol style="list-style-type: none"> 1. Turnover Factor 	<p>All stocks in the Index Universe are ranked, in descending order, based on a combined ranking of Volume Weighted Average Price (VWAP) float-adjusted market capitalization and six-month median daily value traded (MDVT). The 20 stocks with the smallest rankings are selected and form the index. The VWAP float-adjusted market capitalization is calculated by multiplying the number of shares outstanding by the assigned company's IWF and by the VWAP over the prior three-month period.</p> <p>In order to reduce turnover, the selection process is subject to a two-stock buffer, whereby current index constituents remain in the index if they rank among the 22 stocks with the smallest rankings.</p> <p>In cases where two or more stocks have the same combined ranking, the most liquid stock based on MDVT is selected.</p>

			<p>2. VWAP Float-Adjusted Market Capitalization</p> <p>3. Value Traded, calculated as the median of the monthly medians of value traded for the last 12 months. The monthly median value traded is defined as the median of all the daily value traded (Subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations) for a given stock in a given month. The value traded is calculated by multiplying the number of shares traded by each stock's price.</p> <p>After ranking has been assigned for all eligible stocks for each of the above factors, a joint rating is calculated for each company by adding up the three rankings.</p> <p>The 20 stocks with the smallest joint ratings are selected for index inclusion.</p> <p>In cases where two or more stocks have the same joint rating, the stock with the highest VWAP float-adjusted market capitalization is selected.</p>	
S&P/BMV INMEX	Pro-forma Schedule and Pricing Reference Dates	09/15/2017	<p>Pro-forma files are typically provided 5 business days in advance of the rebalancing date.</p> <p>The preliminary index shares are calculated using closing prices from 5 business days prior to the rebalancing date.</p> <p>The final index shares are provided as of the close of trading two business days prior to the rebalancing date and are calculated using closing prices from two business days prior to the rebalancing date.</p>	<p>Pro-forma files are provided five business days prior to the rebalancing or reweighting effective date.</p> <p>Index shares are calculated using closing prices seven business days prior to the rebalancing or reweighting effective date.</p>
S&P/BMV IPC and S&P/BMV INMEX Indices	Rebalancing Schedule	09/15/2017	<p>Index composition is reconstituted annually, effective after the market close on the last business day of August. The rebalancing reference date is the last business day of July. In addition, the index is reweighted outside of the annual rebalancing, effective after the market close on the last business day of February, May, and November.</p>	<p>Index composition is reconstituted semi-annually, effective after the market close on the third Friday of March and September. The rebalancing reference date is the last business day of January and July, respectively. In addition, the index is reweighted outside of the semi-annual rebalancings, effective after the market close on the third Friday of June and December.</p>
All S&P/BMV Total Return Indices ¹⁵	Total Return Calculation	08/31/2017	<p>The BMV total return indices are currently calculated by multiplying the total return index level of the prior day by the variation between the Index Market Capitalization Value and the Adjusted Index Market Capitalization Value affected by dividends of the prior day.</p> $\text{Total Return Index}_t = \text{Total Return Index}_{t-1} * \left(\frac{\text{MCV}}{\text{AMCV}} \right)$ $\text{MCV} = \left(\sum P_{it} * Q_{it} \right)$ $\text{AMCV} = \left(\sum AP_{it-1} * Q_{it-1} \right)$ $AP = P_{it} - D_{it}$ <p>where:</p> <p>MCV = Market Capitalization Value</p> <p>AMCV = Adjusted Market Capitalization Value affected by dividends of the prior day</p> <p>D_{it} = Dividend per share paid for stock i on day t</p> <p>P_{it} = Closing price per share i on day t</p>	<p>The indices follow S&P Dow Jones Indices' standard total return calculation</p> <p>Please refer to S&P Dow Jones Indices' Index Mathematics Methodology for more information on total return calculations.</p>

¹⁵ The S&P/BMV IPC Quality, Value and Growth Index always followed the S&P Dow Jones Indices' standard total return calculation.

			AP_{it-1} = Adjusted Price per share i on day $t - 1$ Q_{it} = Number of index shares i on day t $i = 1, \dots, n$	
S&P/BMV IPC and S&P/BMV INMEX Indices	Stock Replacements	06/28/2017	A replacement is made at the time that a current constituent is removed due to mergers, acquisitions, takeovers, delisting, bankruptcy, suspensions or other reasons that warrant ineligibility.	<p>Socks replacements are added only at the time of the semi-annual rebalancing.</p> <p>For the S&P/BMV IPC Index, in the event that the index's constituent count falls below 30, the Index Committee will review the index to determine if replacement stocks are required in order to maintain the index objective. Advanced notice will be provided prior to the addition of a replacement stock outside of the regularly scheduled index reconstitutions.</p>
S&P/BMV IPC CompMx Index	Company Size Classification	06/16/2017	Company sizes are determined based on float-adjusted market capitalization.	Company sizes are determined based on total market capitalization.
S&P/BMV IPC CompMx Index	Constituent Count	06/16/2017	The index has a fixed constituent count of 60.	The index has a floating number of constituents.
S&P/BMV IPC CompMx Index	Liquidity Criteria and Constituent Selection Process	06/16/2017	<p>Eligible stocks are ranked by the Turnover Factor, calculated as follows:</p> <ol style="list-style-type: none"> Calculate the median share volume (subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations) for each month, for the six months leading up to the rebalance reference date. Divide each of the monthly median share volume figures by the float-adjusted shares outstanding. The float-adjusted shares outstanding are as of the same date used for the median share volume. For example, if the median share volume for a given stock is from the 15th of the month, the float-adjusted shares outstanding are also as of the 15th of that same month. This becomes the monthly turnover ratio. The median of the available monthly turnover ratios from Step 2 is the Turnover Factor. <p>The 70 stocks with the largest turnover factors are then ranked by each of the following factors:</p> <ol style="list-style-type: none"> Turnover Factor. Total company market capitalization, measured as the six month average prior to the rebalancing reference date. Value traded, represented by the median of the monthly medians of value traded for the last six months. The monthly median value traded is defined as the median of all the daily value traded for a given company in a given month. The value traded is calculated by multiplying the number of shares traded (subtracting from the daily volume of each issuer, the volume of Cross Trades that exceeds the average of the market's Cross Trades activity of the last 12 months plus 1.5 standard deviations) by each stock's price. <p>After ranking has been assigned for all eligible companies for each of the above factors, a joint rating is determined for each stock by adding up the three rankings. In cases where two or more stocks have the same joint rating, stocks are ranked in order</p>	<p>In addition to the other eligibility criteria, all stocks in the Index Universe must satisfy the following liquidity criteria in order to become part of the Selection Universe:</p> <ul style="list-style-type: none"> Stocks must have a monthly median traded value ratio (MTVR) of at least 1% over the prior three-month and 12-month periods. Stocks with a MTVR of less than 1%, but greater than 0.5% over the prior three-month and 12-month periods, must have an average daily traded value (ADVT) of at least MXN 10 million over the prior three-month period. Current index constituents remain eligible if they have a MTVR of at least 0.5% over the prior three-month and 12-month periods. The monthly MTVR is determined as follows: <ol style="list-style-type: none"> Calculate the median daily value traded (MDVT) for every month. Calculate the number of days traded for every month. Calculate the month-end float-adjusted market capitalization. $MTVR = (\text{Result from Step 1} * \text{Result from Step 2}) / \text{Result from Step 3}$. Calculate the average MTVR for three months and 12 months. <p>All stocks in the Selection Universe are selected and form the index.</p>

			<p>of the highest float adjusted market capitalization.</p> <p>The 58 stocks with the smallest joint ratings are selected for index inclusion. To reach a count of 60, the two stocks in the remaining eligible list with the highest Turnover Factors are selected for inclusion in the index.</p>	
S&P/BMV IPC CompMx Index	Trading History	06/16/2017	Companies with five or more non-trading days over the last three months prior to the rebalancing reference date are ineligible.	<p>As of the rebalancing reference date:</p> <ul style="list-style-type: none"> Stocks must have traded on at least 90% of the available trading days over the prior 12 month period. For stocks with less than 12 months of trading history (e.g. initial public offerings), the 90% threshold is applied to the available trading history. Current index constituents remain eligible if they have traded on at least 80% of the available trading days over the prior 12 month period and 95% over the prior three month period.
S&P/BMV IPC CompMx Index	Multiple Share Classes	06/16/2017	If a company has multiple share classes, the most liquid share class based on Marketability Scores is selected.	If a company has multiple share classes, all share classes are eligible provided that they individually satisfy the other eligibility criteria. Each share class line included in the index is weighted based on its individual float-adjusted market capitalization.
S&P/BMV IPC CompMx Index	IPO Eligibility and Inclusion	06/16/2017	Significantly sized IPOs or securities performing large secondary public offerings (also known as placements) are added if the security meets all index eligibility criteria. In addition, the stock's float-adjusted market capitalization must be at least 0.5% of the aggregate of all float-adjusted market capitalization of the S&P/BMV IPC CompMx Index constituents as of the close of its first trading day. Eligible stocks are added to the index three months after the closest scheduled rebalancing, effective after the market close of the last business day of either January or July. When stocks are added as a result of this rule, the number of constituents in the index increases until the next scheduled rebalancing, when the number of constituents is set back to the target count 60.	IPOs or securities performing large secondary public offerings (also known as placements) are added to the index if the security meets all index eligibility criteria and is among the top five companies based on float-adjusted market capitalization at the semi-annual rebalance. If eligible, such securities are added to the index only at the semi-annual rebalancing.
S&P/BMV IPC LargeCap, MidCap, and SmallCap Indices	Multiple Share Classes	06/16/2017	If a company has multiple share classes, the most liquid share class based on Marketability Scores is selected.	If a company has multiple share classes, the most liquid share class based on the MTVR over the prior 12-month period is selected.
S&P/BMV IPC LargeCap, MidCap, and SmallCap Indices	Constituent Selection Size Segments	06/16/2017	<p>Stocks in the S&P/BMV IPC CompMx Index are ranked by float-adjusted market capitalization.</p> <ul style="list-style-type: none"> The largest 20 stocks are selected and form the BMV IPC LargeCap. Stocks ranked 21 to 40 are selected and form the S&P/BMV IPC MidCap Index. The 20 smallest stocks are selected and form the S&P/BMV IPC SmallCap Index. 	<p>Size segments are based on the cumulative market capitalization within the S&P/BMV IPC CompMx. Companies are ranked by total market capitalization, and then total company market capitalization is accumulated to 75% forming the S&P/BMV LargeCap Index, the next 20% forming the S&P/BMV MidCap Index, and the final 5% forming the S&P/BMV SmallCap Index.</p> <p>If a company has multiple share classes, the share classes are combined to measure the company's total market cap.</p>
S&P/BMV IPC LargeCap, MidCap, and SmallCap Indices	Constituent Selection Buffer Rule	06/16/2017	--	A 3% buffer is applied to each index during rebalancing to minimize unnecessary turnover.
S&P/BMV IPC LargeCap, MidCap, and SmallCap Indices	Minimum Constituent Count	06/16/2017	Each index has a fixed constituent count of 20 stocks.	A 10 stock minimum constituent count is required for each index.

S&P/BMV IPC LargeCap, MidCap, and SmallCap Indices	Constituent Weighting	06/16/2017	Each index is weighted based on float-adjusted market capitalization, subject to the following: <ul style="list-style-type: none"> No single stock's weight can exceed 25%. The aggregate weight of the five largest stocks cannot exceed 60%. 	Each index is weighted based on float-adjusted market capitalization, subject to the following: <ul style="list-style-type: none"> No single stock's weight can exceed 25%. The aggregate weight of the five largest stocks cannot exceed 60%. Basket liquidity is applied to each index using a portfolio size of MXN 200 million to be turned over in one business day at 100% of its six-month median daily value traded. The index committee reserves the right to change the portfolio size if market conditions or other factors require it.
S&P/BMV Economic Activity Indices	Rebalancing Schedule	06/16/2017	Index composition is reconstituted annually, effective after the market close on the last business day of May.	Index composition is reconstituted annually, effective after the market close on the third Friday of June. The rebalancing reference date is the last business day of April. In addition, each index is reweighted quarterly outside of the annual rebalancing, effective after the market close on the third Friday of March, September, and December.
S&P/BMV Economic Activity Indices	Economic Activity Clusters	06/16/2017	Eligible stocks are classified into each of the below economic sectors based on a proprietary industry classification system created by the Mexico Stock Exchange: <ol style="list-style-type: none"> S&P/BMV Mining & Agriculture Index: Mining and Agriculture S&P/BMV Manufacturing, Electricity, & Water Index: Manufacturing Industry, Electricity, Gas and Water Sectors S&P/BMV Construction Index: Construction S&P/BMV Retail & Distributors Index: Retail and Distributors S&P/BMV Infrastructure & Transportation Index: Infrastructure and Transportation S&P/BMV Financial Services Index: Financial Services S&P/BMV Commercial Services Index: Commerce and Services 	Please refer to <i>Appendix I</i> for the makeup of the new Economic Activity Clusters.
All S&P/BMV Indices	Suspensions	06/02/2017	For suspended index constituents, the price used for calculation is provided by the Price Vendors authorized by the "Comisión Nacional Bancaria y de Valores" in their price vector. If there is no consensus between these Price Vendors, BMV uses the mean value. Stocks are deleted from the index once their suspension period has reached 20 consecutive business days using the price as stated above.	For suspended stocks, the last available official closing price prior to the suspension is used for index calculation during the suspension period. Suspended stocks that exceed a threshold of 20 business days are reviewed for possible index deletion. Any deletion is made using a stock price of zero and with five days' advanced notice.
All S&P/BMV Indices	Capital Repayments	06/02/2017	Capital repayments are always treated with a corresponding price adjustment even if it is declared as ordinary per the historical pattern.	A capital repayment is treated as an ordinary cash dividend when declared in lieu of an ordinary dividend and it is consistent with historical patterns for both amount and frequency.
All S&P/BMV Indices	Spin-offs	06/02/2017	Spin-offs added at the market price on the ex-date.	A spun-off entity is added to all indices of which the parent is a constituent, at a zero price at the market close of the day before the ex-date. There is no divisor change. All key attributes of the spun-off company are the same as the parent's at the time of addition. For more information please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices document.
All S&P/BMV Indices	Dividends for U.S. Listings	06/02/2017	Dividends net of withholding tax are reinvested for gross total return indices.	Gross dividends are reinvested for gross total return indices.
All S&P/BMV Indices	Dividend Conversion	06/02/2017	BANXICO Exchange rates are used for any dividend conversions.	The Valmer FX spot rate captured at 2:00 PM Mexico City time is used for dividend conversion in the event that a constituent pays a dividend in a currency other than the Mexican peso (MXN).
All S&P/BMV Indices	Pro-forma Schedule and Pricing Reference	06/02/2017	Preliminary index shares are provided and calculated using closing prices from five business days prior to the rebalancing date. Final index shares are provided and	Index shares are assigned based on prices two business days prior to the pro-forma date and pro-forma files are provided five business days in advance of the rebalancing effective date (10 business days in advance

	Dates during Rebalancing		calculated using closing prices from two business days prior to the rebalancing date.	of the rebalancing effective date for the March and September rebalancing for the S&P/BMV IPC Index).
S&P/BMV Bursa Optimo, IPC CompMx, IPC LargeCap, IPC MidCap, IPC SmallCap, China SX20, Mexico-Brazil, Brazil 15, FIBRAS, and Dividend Indices	Shares and Float changes	06/02/2017	Shares and float changes are applied to the indices intra-rebalancing.	Shares outstanding or IWF changes have no effect on index weights. To neutralize the impact, an additional weight factor (AWF) is assigned to the applicable constituent in order to maintain constant index share counts before and after the event. For more information on Non-Market Capitalization Weighted Indices, please refer to S&P Dow Jones Indices' Index Mathematics Methodology.
All S&P/BMV Indices	Real-time Calculations	06/02/2017	The indices use VWAP or last traded price depending on trading during the last 20 minutes prior to the market close.	Consistent with international standards, the indices only use actual trades for intraday real-time index calculations.
S&P/BMV Brazil 15, China SX20, and Mexico-Brazil Indices	Exchange Rates	06/02/2017	Mexican peso / U.S. dollar mid-market spot FX rate captured at 3:10 PM Mexico City time "MXN =", (BID+ASK)/2.	Valmer Mexican peso / U.S. dollar FX spot rate captured at 2:00 PM Mexico City time.
All S&P/BMV Indices except for S&P/BMV IPC and S&P/BMV INMEX Indices	Rebalancing Schedule	06/02/2017	Indices were rebalanced effective on the first business day of the month. The rebalancing reference date is the last business day of the month, two months prior to the rebalancing effective date.	Indices are rebalanced effective after the close on the third Friday of March, June, September, and December. The rebalancing reference date is the last business day of the month, two months prior to the rebalancing effective date. Please refer to Eligibility Criteria and Index Construction for each index's rebalancing schedule.

BMV IPC CompMx, LargeCap, MidCap, and SmallCap Indices	Rebalancing Schedule	04/01/2017	The index is rebalanced semi-annually effective after the close on the last business day of April and October.	The index is rebalanced semi-annually, effective after the market close on the third Friday of June and December. The rebalancing reference date is the last business day of April and October, respectively.
BMV Profitable Index	Deletions	03/17/2017	Constituents are deleted from the index at each annual rebalancing.	Constituents are deleted at each rebalancing or reweighting if they eliminate their dividend.
BMV Profitable Index	Constituent Weighting	03/17/2017	Constituents are weighted based on float-adjusted market capitalization, subject to an individual stock weight cap of 10%.	Constituents are weighted based on five year average income, calculated as: Rolling average five year dividends * shares outstanding * float factor.
All BMV Indices	Shares and Float Change Implementation	12/01/2016	Daily share changes are applied to the indices regardless of the size of the change.	The BMV Indices follow S&P Dow Jones Indices' Shares and Float Change Policy. For more information please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices document.
BMV FIBRAS Index	Minimum trading history for newly listed FIBRAS	11/08/2016	If there are less than 20 certificates in the index then any new FIBRAS with at least three months of trading is included on the first day this condition is met.	Newly listed FIBRAS are only added to the index at the rebalancing if they have a trading history of at least three months.
All BMV Indices except for BMV IPC and INMEX Indices	Constituent replacement policy	11/01/2016	A replacement is made at the time that a current constituent is removed due to mergers, acquisitions, takeovers, delisting, bankruptcy, suspensions or other reasons that warrant ineligibility.	Constituent replacements are only added to an index at rebalancing.
All BMV Indices	Announcements of additions and deletions	11/01/2016	Advanced notice is not always provided for additions and deletions.	Additions and deletions are announced with one to five days advanced notice prior to any changes becoming effective.

This document does not constitute an offer of services in jurisdictions where S&P Dow Jones Indices LLC, S&P, S&P Trucost Limited, SAM (part of S&P Global), Dow Jones or their respective affiliates (collectively "S&P Dow Jones Indices") do not have the necessary licenses. Except for certain custom index calculation services, all information provided by S&P Dow Jones Indices is impersonal and not tailored to the needs of any person, entity or group of persons. S&P Dow Jones Indices receives compensation in connection with licensing its indices to third parties and providing custom calculation services. Past performance of an index is not an indication or guarantee of future results.

It is not possible to invest directly in an index. Exposure to an asset class represented by an index may be available through investable instruments based on that index. S&P Dow Jones Indices does not sponsor, endorse, sell, promote or manage any investment fund or other investment vehicle that is offered by third parties and that seeks to provide an investment return based on the performance of any index. S&P Dow Jones Indices makes no assurance that investment products based on the index will accurately track index performance or provide positive investment returns. S&P Dow Jones Indices LLC is not an investment advisor, and S&P Dow Jones Indices makes no representation regarding the advisability of investing in any such investment fund or other investment vehicle. A decision to invest in any such investment fund or other investment vehicle should not be made in reliance on any of the statements set forth in this document. Prospective investors are advised to make an investment in any such fund or other vehicle only after carefully considering the risks associated with investing in such funds, as detailed in an offering memorandum or similar document that is prepared by or on behalf of the issuer of the investment fund or other investment product or vehicle. S&P Dow Jones Indices LLC is not a tax advisor. A tax advisor should be consulted to evaluate the impact of any tax-exempt securities on portfolios and the tax consequences of making any particular investment decision. Inclusion of a security within an index is not a recommendation by S&P Dow Jones Indices to buy, sell, or hold such security, nor is it considered to be investment advice.

liable to any party for any direct, indirect, incidental, exemplary, compensatory, punitive, special or consequential damages, costs, expenses, legal fees, or losses (including, without limitation, lost income or lost profits and opportunity costs) in connection with any use of the Content even if advised of the possibility of such damages.

S&P Global keeps certain activities of its various divisions and business units separate from each other in order to preserve the independence and objectivity of their respective activities. As a result, certain divisions and business units of S&P Global may have information that is not available to other business units. S&P Global has established policies and procedures to maintain the confidentiality of certain non-public information received in connection with each analytical process.

In addition, S&P Dow Jones Indices provides a wide range of services to, or relating to, many organizations, including issuers of securities, investment advisers, broker-dealers, investment banks, other financial institutions and financial intermediaries, and accordingly may receive fees or other economic benefits from those organizations, including organizations whose securities or services they may recommend, rate, include in model portfolios, evaluate or otherwise address.

The Global Industry Classification Standard (GICS®) was developed by and is the exclusive property and a trademark of S&P and MSCI. Neither MSCI, S&P nor any other party involved in making or compiling any GICS classifications makes any express or implied warranties or representations with respect to such standard or classification (or the results to be obtained by the use thereof), and all such parties hereby expressly disclaim all warranties of originality, accuracy, completeness, merchantability or fitness for a particular purpose with respect to any of such standard or classification. Without limiting any of the foregoing, in no event shall MSCI, S&P, any of their affiliates or any third party involved in making or compiling any GICS classifications have any liability for any direct, indirect, special, punitive, consequential or any other damages (including lost profits) even if notified of the possibility of such damages.
