

# **S&P GSCI Roll Weight Select *Methodology***

January 2021

# Introduction

## Index Objective

The S&P GSCI® Roll Weight Select is designed to measure the performance of commodities from an underlying index, where the commodities in the index are weighted by the relative change in the realized roll yield. The index underweights or overweights commodities depending on the roll yield at the current month than at the one-month forward expiration, as described under *Weighting Scheme*.

## The S&P GSCI® Roll Weight Select Methodology

This methodology uses various terms from the S&P GSCI® Methodology. Where not specifically noted otherwise in this document, the rules of the S&P GSCI® will prevail. Where the terms in this document are also defined in the S&P GSCI® Methodology, the definitions in this document prevail.

## Supporting Documents

This methodology is meant to be read in conjunction with supporting documents providing greater detail with respect to the policies, procedures and calculations described herein. References throughout the methodology direct the reader to the relevant supporting document for further information on a specific topic. The list of the main supplemental documents for this methodology and the hyperlinks to those documents is as follows:

Supporting Document	URL
S&P Dow Jones Indices' Commodities Indices Policies & Practices Methodology	<a href="#">Commodities Indices Policies &amp; Practices</a>
S&P Dow Jones Indices' Index Mathematics Methodology	<a href="#">Index Mathematics Methodology</a>

This methodology was created by S&P Dow Jones Indices to achieve the aforementioned objective of measuring the underlying interest of each index governed by this methodology document. Any changes to or deviations from this methodology are made in the sole judgment and discretion of S&P Dow Jones Indices so that the index continues to achieve its objective.

**Index Eligibility.** Only the 14 commodities that are included in the S&P GSCI® Equal Weight Select (underlying index) are included in the S&P GSCI® Roll Weight Select. Please refer to the S&P GSCI® Equal Weight Select Methodology for details on the index eligibility process. The reconstitution occurs annually.

**Weighting Scheme.** On the determination date, each of the 14 commodities is weighted according to its rank of relative change in realized roll yield. The commodity with the highest (lowest) change in realized roll yield, indicating the roll yield is less (more) in the current month than the 1-month forward contract, is given the lowest rank of 1 (highest rank of 14).

The following table summarizes the rank order and final ranking weights:

Rank Order with Weighting Scheme	
Rank	Rank Weight
1 - 4	2.8%
5 - 12	8.3%
13 - 14	11.1%

Please see the Calculation Appendix below for further information.

## Calculation Appendix

### ***Determination of the gradient signal from each commodity***

For each commodity “A”, at each monthly node  $i$  (for  $i=0$  and  $i=1$ ), for a given month  $m$ , the following notation is adopted:

$A\_PL(0,m)$  = the index level of S&P GSCI® A, for month  $m$ , (as of the Determination Date specified)

$A\_PL(1,m)$  = the index level of S&P GSCI® A 1 Month Forward, for month  $m$ ,

$A\_EL(0,m)$  = the index level of S&P GSCI® A ER, for month  $m$ ,

$A\_EL(1,m)$  = the index level of S&P GSCI® A 1 Month Forward ER, for month  $m$ .

These four inputs, define the following variables

$A\_PR(i,m)$  = Price index return for commodity A, at node  $i$ , for month  $m$

$$= ( A\_PL(i,m) - A\_PL(i,m-1) ) / A\_PL(i,m-1),$$

$A\_ER(i,m)$  = Excess Return index return for commodity A, at node  $i$ , for month  $m$

$$= ( A\_EL(i,m) - A\_EL(i,m-1) ) / A\_EL(i,m-1).$$

The following relationship, for a given commodity A, at node  $i$ , for month  $m$  is defined as:

$A\_RRY(i,m)$  = Realized Roll Yield for commodity A, at node  $i$ , for month  $m$ ,

$$= A\_ER(i,m) - A\_PR(i,m).$$

Thus, the realized roll yield  $A\_RRY(i,m)$  is a proxy of the monthly roll yield for commodity A, incorporating the effects of the daily changes in the prices, as well as the effects of the rolling of the relevant contracts during the month, as specified in the S&P GSCI® methodology.

### ***Interpolation of S&P GSCI® Realized Roll Yields***

Any A commodity that does not roll monthly will require an interpolation of its realized roll yield.

The Interpolated Realized Roll Yield for each commodity A, is defined as follows:

$$A\_IRRY(i,m) = A\_ARRY(i,m) / A\_IF(i,m),$$

Where,

$A\_ARRY(i,m)$  is the adjusted realized roll yield of A, for node  $i$ , for month  $m$ , and

$A\_IF(i,m)$  is the interpolation factor of A, for node  $i$ , for month  $m$ .

The realized roll yield is adjusted in the event that no rolling is involved by carrying over the previously calculated realized roll yield based on the commodities contract calendar. The interpolation factor is a count of consecutive months for an individual commodity. The interpolation is achieved by dividing the adjusted realized roll yield by its respective interpolation factor.

We now define the following relationship, for a given commodity A, at node  $i$ , for month  $m$ :

$A\_GD(i+1,m)$  = gradient for commodity A, at node  $(i+1)$ , for month  $m$ ,

$$= A\_IRRY(i+1,m) - A\_IRRY(i,m).$$

The gradient  $A\_GD(1,m)$  is a measure of the change in the interpolated realized roll yields for commodity A, at node 1 and node 0, respectively, for a given month m. Additionally, if commodity A is in a state of contango, i.e., if  $A\_RRY(0,m)$  and the gradient are both negative, then the sign of the gradient is reversed. The gradient is also reversed if commodity A is in a state of backwardation, i.e., if  $A\_RRY(0,m)$  and the gradient are both positive. The sign reversal is implemented to so that commodities in backwardation are preferred to those in contango, other things being equal, in cases where the forward curve deviates from normal patterns.

For roll schedules please see the S&P GSCI® methodology.

**Example.** This section illustrates the interpolation process, using Sugar as an example, for the S&P GSCI® Sugar 1 Month Forward. See Table 1 below.

For January, the realized roll yield for Sugar is shown in column 4 ( $RRY=0.0187$ ). Based on Sugar's roll schedule, it was long the same contract in the following month (the May contract, K), its unadjusted realized roll yield for February is equal to 0, as a result of no rolling of contracts. The unadjusted realized roll yield for February is then superseded by January's realized roll yield. For January and February, the interpolated realized roll yield is obtained by dividing the adjusted realized roll yield by the interpolation factor for the given month. Thus, the interpolation factor of 2 for January and February is applied, spreading the unadjusted realized roll yield over the 2-month period. The interpolation factor is a function of how many months the same futures contracts are in force. Thus, for March and April, the interpolation factor is again 2 because the July contract (N) is in use. Likewise, the unadjusted realized roll yield for April is filled in with the realized roll yield for March. However, for May through July, the October contract (V) is in use for the three months. When the realized roll yield for sugar is calculated, it is spread over the three month time period. In the case of August until December, the upcoming March (H) Contract has an interpolation factor set at 5.

Table 1: Example of Sugar (SB) S&P GSCI Sugar 1 Month Forward					
Col.1 Month	Col.2 Interpolation Factor	Col.3 Contract Month	Col.4 RRY	Col.5 Adjusted	Col.6 Interpolated RRY
Jan	2	K	0.0187	0.0187	0.0093
Feb	2	K	0.0000	0.0187	0.0093
Mar	2	N	0.0375	0.0375	0.0187
Apr	2	N	0.0000	0.0375	0.0187
May	3	V	-0.0176	-0.0176	-0.0059
Jun	3	V	0.0000	-0.0176	-0.0059
Jul	3	V	0.0000	-0.0176	-0.0059
Aug	5	H	-0.0210	-0.0210	-0.0042
Sep	5	H	0.0000	-0.0210	-0.0042
Oct	5	H	0.0000	-0.0210	-0.0042
Nov	5	H	0.0000	-0.0210	-0.0042
Dec	5	H	0.0000	-0.0210	-0.0042

**S&P GSCI® Energy & Metals Roll Weight Select Capped Component.** The S&P GSCI Energy & Metals Roll Weight Select Capped Component index manages the roll yield by modifying the weights according to the relative change in the realized roll yield for each of the commodities in the S&P GSCI energy and metals sectors.

**Index Eligibility.** The nine energy and metals commodities that are included in the S&P GSCI Roll Weight Select are included in the S&P GSCI® Energy & Metals Roll Weight Select Capped Component. The reconstitution occurs annually.

**Capping Frequency.** Quarterly; the capping process is performed according to the following rules, in succession:

1. Only one component can reach a maximum weight of 32%. Any excess weight is distributed proportionately among the remaining components.
2. No remaining component's weight can exceed 17%. Any excess weight is distributed proportionately among the remaining components.

**Determination Date.** One S&P GSCI Business Day before the first quarterly roll date (January, April, July and October).

**Components:** The four commodities below are treated as one component based on their similarity:

- **Petroleum:** WTI Crude Oil, Brent Crude Oil, Gasoil, and Unleaded Gasoline.

### Currency of Calculation and Additional Index Return Series

In addition to the indices detailed in this methodology, additional return series versions of the indices may be available, including, but not limited to: currency, currency hedged, decrement, fair value, inverse, leveraged, and risk control versions. For a list of available indices, please refer to the [S&P DJI Methodology & Regulatory Status Database](#).

*For information on index calculation, please refer to S&P Dow Jones Indices' Index Mathematics Methodology.*

*For the inputs necessary to calculate certain types of indices, including decrement, dynamic hedged, fair value, and risk control indices, please refer to the Parameters documents available at [www.spdji.com](http://www.spdji.com).*
