Introduction

Index Objectives and Highlights

Each index in the S&P Managed Risk 2.0 Index Series is composed of an underlying equity index, underlying fixed income index, and an underlying cash equivalent index. Each index is designed to limit risk by allocating among the underlying equity index, fixed income index, and cash equivalent index, based on the realized volatilities in the underlying equity and fixed income indices. The representation of underlying equity and fixed income indices is hedged with a synthetic put position to further reduce downside risk.

Collaboration

The S&P Managed Risk 2.0 Index Series is generated and published under agreements between S&P Dow Jones Indices and Milliman Financial Risk Management LLC.

Each S&P Managed Risk 2.0 Index allocates to the underlying equity index and fixed income index based on the realized volatilities of the underlying equity and fixed income indices.

The target allocations to the underlying indices are calculated to maintain volatility within a fixed threshold of the target volatility level.

Each index hedges its downside risk by replicating a constant maturity put option on the volatility managed portfolio. To remove dependency on the term structure of interest rates, the strike of the option is expressed in “forward moneyness” terms. This forward strike is determined each day from a moving average of a multiple of the index level.

Please refer to Appendix E for a full list of index parameters.

Supporting Documents

This methodology is meant to be read in conjunction with supporting documents providing greater detail with respect to the policies, procedures and calculations described herein. References throughout the methodology direct the reader to the relevant supporting document for further information on a specific topic. The list of the main supplemental documents for this methodology and the hyperlinks to those documents is as follows:

Supporting Document	URL
S&P Dow Jones Indices’ Equity Indices Policies & Practices Methodology	Equity Indices Policies & Practices
S&P Dow Jones Indices’ Fixed Income Policies & Practices Methodology	Fixed Income Policies & Practices
S&P Dow Jones Indices’ Index Mathematics Methodology	Index Mathematics Methodology
S&P Dow Jones Indices’ Fixed Income Index Mathematics Methodology	Index Mathematics Methodology

This methodology was created by S&P Dow Jones Indices to achieve the aforementioned objective of measuring the underlying interest of each index governed by this methodology document. Any changes to or deviations from this methodology are made in the sole judgment and discretion of S&P Dow Jones Indices so that the index continues to achieve its objective.

Index Construction

Approaches

Each S&P Managed Risk 2.0 Index allocates to an underlying equity index and an underlying fixed income index based on the realized volatilities in the underlying indices.

To calculate the target allocation to the underlying equity and fixed income indices, the S&P Managed Risk 2.0 Index:

1. Uses an exponentially weighted risk control model to calculate the realized variance of both the underlying equity and fixed income indices, and the realized covariance between the two underlying indices.
2. Uses Black Scholes theory to calculate synthetic self-financing put option premiums and hedge allocations.
3. Adjusts the allocation weights of the underlying equity and fixed income indices in order to satisfy the portfolio target volatility and position constraints. The allocation is chosen to maximize the equity allocation. If multiple allocations are found, the allocation that also maximizes the fixed income allocation is selected.

The index hedges its downside risk by replicating a constant maturity put option on the index. The forward strike level of the put is an asymmetric exponentially weighted moving average of a multiple of the index level. The net hedge allocation is calculated per the Black Scholes model, replicating a put option with a short position in the respective S&P Managed Risk 2.0 Index and a long position in the underlying fixed income index.

Rebalancing

The allocation weights of the underlying equity and fixed income indices are calculated daily, a rebalancing may be triggered when the change of the equity weight exceeded the minimum daily allocation. Please refer to Final Asset Weights for more details.

Parameters

Parameter	Description
M	Protection Term
σ	Target Volatility
ϵ	Target Volatility Threshold
	Upward Strike Mean Reversion Period
	Downward Strike Mean Reversion Period
τ	Yield Premium Mean Reversion Period
k	Strike Multiplier
	Upper Term Yield Premium
	Lower Term Yield Premium
	Maximum Daily Allocation Change
	Minimum Daily Allocation Change

Variables

Variable	Description
Δt	Time between day t and $t-1$, in years
A	Current Index Level
K_t	Current Forward Strike Price
K_{t-1}	Prior Day Forward Strike Price
H	Current Black Scholes Hedge Allocation of the Replicating Put Option
D	Current Modified Duration of the Underlying Fixed Income Index
$mmWE$	Mark-to-Market Equity Weight
$mmWB$	Mark-to-Market Fixed Income Weight
$thWE$	Theoretical Equity Weight
$thWB$	Theoretical Fixed Income Weight
tWE	Target Equity Weight
tWB	Target Fixed Income Weight
$vmWE$	Volatility Management Equity Weight
$vmWB$	Volatility Management Fixed Income Weight
WE,t	Current Equity Weight
WB,t	Current Fixed Income Weight
$WE,t-1$	Equity Weight on $t-1$
$WB,t-1$	Fixed Income Weight on $t-1$
σ_t^2	Current Target Variance
θ	Maximum Volatility Management Fixed Income Weight
r_B	Prior Day Fixed Income Yield to Maturity
r	Prior Day Cash Money Market Interest Rate
S_t	Current Average Term Yield Premium
S_{t-1}	Prior Day Average Term Yield Premium
ω	Maximum Fixed Income Fraction
φ	Asset Allocation Change Fraction
E	The Underlying Equity Index Level
B	The Underlying Fixed Income Index Level
C	The Underlying Cash Equivalent Index Level

Total Return Index Calculations

On any business day t , the total return index value is calculated as:

$$= IndexTR_{t-1} * \left(1 + W_{E,t-1} * \left(\frac{E_t}{E_{t-1}} - 1 \right) + W_{B,t-1} * \left(\frac{B_t}{B_{t-1}} - 1 \right) + (1 - W_{E,t-1} - W_{B,t-1}) * \left(\frac{C_t}{C_{t-1}} - 1 \right) \right) \quad (1)$$

where:

$IndexTR_{t-1}$ = The total return index level on $t-1$.

Put Option Replication

The index is hedged by a synthetic put option overlay. Both the put's term and volatility are constant. Its forward strike price, K_t , follows an asymmetric exponentially weighted moving average of a multiple of the index level. When the strike is below (above) the target multiple of the index level, kA , its mean reverts upward (downward) within the respective reversion period. The strike is capped at the current index level, A , to ensure the self-financing ability of the put.

$$K_t = \begin{cases} K_{t-1} + \frac{\Delta t}{\tau^+} (k * A_t - K_{t-1})K & \text{if } K_{t-1} \leq k * A_t \\ K_{t-1} + \frac{\Delta t}{\tau^-} (k * A_t - K_{t-1})K & \text{if } k * A_t < K_{t-1} \leq A_t \\ A_t K & \text{otherwise} \end{cases} \quad (2)$$

To avoid borrowing funds, a portion of the index is sold to finance the put option position. This requires solving the equation below:

$$P_t = V(A_t - P_t, K_t) \quad (3)$$

where:

P_t = Put option premium

V = Black Scholes put option price calculated as:

$$V(A_t - P_t, K_t) = K_t * N\left(\frac{1}{\sigma\sqrt{M}} \ln \frac{K_t}{A_t - P_t} + \frac{1}{2} \sigma\sqrt{M}\right) - (A_t - P_t) * N\left(\frac{1}{\sigma\sqrt{M}} \ln \frac{K_t}{A_t - P_t} - \frac{1}{2} \sigma\sqrt{M}\right) \quad (4)$$

where N is the standard cumulative normal density function.

The net hedge allocation, H_t , is calculated as the delta hedge less the price of the put, scaled by the index level at t :

$$H_t = \frac{-(A_t - P_t) \times N\left(\frac{1}{\sigma\sqrt{M}} \ln \frac{K_t}{A_t - P_t} - \frac{1}{2} \sigma\sqrt{M}\right) - P_t}{A_t}$$

Using equation 4, this simplifies to

$$H_t = -\frac{K_t}{A_t} * N\left(\frac{1}{\sigma\sqrt{M}} \ln \frac{K_t}{A_t - P_t} + \frac{1}{2} \sigma\sqrt{M}\right) \quad (5)$$

Per Black Scholes theory, replicating the put option requires a short position in the respective S&P Managed Risk 2.0 Index and a long position in the underlying fixed income index, duration-adjusted to match a zero coupon bond with maturity M . The target asset weights are thus determined from the volatility managed weights.

$$tw_{E,t} = (1 + H_t) * vmw_{E,t} \quad (6a)$$

$$tw_{B,t} = (1 + H_t) * vmw_{B,t} - H_t * \frac{M}{D} \quad (6b)$$

Portfolio Constraints

Volatility Constraints. Both the short- and long-term variance of the portfolio should not exceed the current target variance.

$$\begin{aligned} &vmw_{E,t}^2 * EquityVariance_{S,t} + vmw_{B,t}^2 * FIVariance_{S,t} \\ &+ 2 * vmw_{E,t} * vmw_{B,t} * Covariance_{S,t} \leq \sigma_t^2 \end{aligned} \tag{7a}$$

$$\begin{aligned} &vmw_{E,t}^2 * EquityVariance_{L,t} + vmw_{B,t}^2 * FIVariance_{L,t} \\ &+ 2 * vmw_{E,t} * vmw_{B,t} * Covariance_{L,t} \leq \sigma_t^2 \end{aligned} \tag{7b}$$

See Appendix B for details on setting the current target variance.

Position Constraints. Leveraged and short positions are avoided.

$$tw_{E,t} + tw_{B,t} \leq 1 \quad (7c)$$

$$tw_{E,t} \geq 0 \quad (7d)$$

$$tw_{B,t} \geq 0 \quad (7e)$$

Index Weights

Volatility Managed Weights. The volatility managed weights are chosen to maximize the target equity weight tw_E while satisfying the portfolio constraints (7a)-(7e). In the case that there is not a unique maximum equity exposure among the variable candidates then the solution will be chosen that furthermore maximizes the target fixed income weight tw_B .

See Appendix C and D for an explicit step-by-step algorithm.

Final Asset Weights. Volatility management is combined with put option replication to determine the final asset weights. Additional adjustments are made to avoid underperformance due to a persistent negative term yield premium, to limit concentrated allocation shifts, and to reduce turnover:

- **Term Yield Premium.** In most market cycles a fixed income asset with positive duration provides a positive term yield premium. Should a negative term yield premium occurs, a partial or entire allocation to cash is substituted for the fixed income asset in order to avoid performance erosion.

The average term yield premium is calculated as an exponentially weighted moving average of the spread between the yield to maturity and the cash money market rate.

$$s_t = \left(1 - \frac{\Delta t}{\tau}\right) s_{t-1} + \frac{\Delta t}{\tau} (r_B - r) \quad (8)$$

The fraction of the non-equity component of the index invested in the fixed income index is capped by the maximum fixed income fraction, determined from the prior day average term yield premium as:

$$\omega_t = \min\left(1, \max\left(0, \frac{s_{t-1} - \underline{s}}{s - \underline{s}}\right)\right) \quad (9)$$

- **Daily Change Cap.** The size of the daily adjustment in the final asset weights towards the target asset weights is limited by the asset allocation change fraction, calculated as:

$$\varphi_t = \min\left(1, \frac{\bar{\delta}}{|tw_{E,t} - mmw_{E,t}|}, \frac{\bar{\delta}}{|\min(tw_{B,t}, \omega_t * (1 - tw_{E,t})) - mmw_{B,t}|}\right) \quad (10)$$

- **Theoretical Asset Weights.** Apply the maximum fixed income fraction and the asset allocation change fraction, as defined in (9) and (10), to the target asset weights to determine the daily theoretical asset weights. The theoretical asset weights are marked-to-market to incorporate the daily change of the underlying indices:

$$thw_{E,t} = \varphi_t * tw_{E,t} + (1 - \varphi_t) * mmw_{E,t} \quad (11a)$$

$$thw_{B,t} = \varphi_t * \min(tw_{B,t}, \omega_t * (1 - tw_{E,t})) + (1 - \varphi_t) * mmw_{B,t} \quad (11b)$$

where:

$mmw_{E,t}$ = market-to-market equity weight calculated in (12a)

$mmw_{B,t}$ = market-to-market fixed income weight calculated in (12b)

$$mmw_{E,t} = \frac{thw_{E,t-1} * \frac{E_t}{E_{t-1}}}{thw_{E,t-1} * \frac{E_t}{E_{t-1}} + thw_{B,t-1} * \frac{B_t}{B_{t-1}} + (1 - thw_{E,t-1} - thw_{B,t-1}) * \frac{C_t}{C_{t-1}}} \quad (12a)$$

$$mmw_{B,t} = \frac{thw_{B,t-1} * \frac{B_t}{B_{t-1}}}{thw_{E,t-1} * \frac{E_t}{E_{t-1}} + thw_{B,t-1} * \frac{B_t}{B_{t-1}} + (1 - thw_{E,t-1} - thw_{B,t-1}) * \frac{C_t}{C_{t-1}}} \quad (12b)$$

- **Final Asset Weights.** To reduce the number of small trades, the index calculates the difference between the theoretical equity weight and a reference equity weight and triggers a rebalancing only when the difference is above the Minimum Daily Allocation Change, unless the minimum transaction size is preventing the portfolio from reaching maximum equity exposure.

The reference equity weight is determined as:

If TradeBoolean_{t-1} = True

Then

$$refw_{E,t} = thw_{E,t-1}$$

Else

$$refw_{E,t} = W_{E,t}$$

The trade decision (*TradeBoolean* above) is based on the difference between the theoretical and reference equity weights:

$$\text{If } |refw_{E,t} - thw_{E,t}| \geq \underline{\delta}$$

Then

$$TradeBoolean_t = True$$

Else

$$\text{If } thw_{E,t} = 1 \text{ and } W_{E,t} < 1 \text{ and not } (thw_{E,t-1} = 1 \text{ and } W_{E,t-1} < 1)$$

Then

$$TradeBoolean_t = True$$

Else

$$TradeBoolean_t = False$$

The final asset weights are determined by the two-day lagged theoretical weights in the event that a trade was triggered. Otherwise, they are determined by marking to market the prior day's weights:

If TradeBoolean_{t-2} = True

Then

$$W_{E,t} = thw_{E,t-2}$$

$$W_{B,t} = thw_{B,t-2}$$

Else

$$W_{E,t} = \frac{W_{E,t-1} * \frac{E_t}{E_{t-1}}}{W_{E,t-1} * \frac{E_t}{E_{t-1}} + W_{B,t-1} * \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) * \frac{C_t}{C_{t-1}}}$$

$$W_{B,t} = \frac{W_{B,t-1} * \frac{B_t}{B_{t-1}}}{W_{E,t-1} * \frac{E_t}{E_{t-1}} + W_{B,t-1} * \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) * \frac{C_t}{C_{t-1}}}$$

Index Governance

Index Committee

An S&P Dow Jones Indices' Index Committee maintains the indices. The Index Committee meets regularly. At each meeting, the Index Committee reviews any significant market events. In addition, the Index Committee may revise index policy for timing of rebalancings or other matters.

S&P Dow Jones Indices considers information about changes to its indices and related matters to be potentially market moving and material. Therefore, all Index Committee discussions are confidential.

S&P Dow Jones Indices' Index Committees reserve the right to make exceptions when applying the methodology if the need arises. In any scenario where the treatment differs from the general rules stated in this document or supplemental documents, clients will receive sufficient notice, whenever possible.

In addition to the daily governance of indices and maintenance of index methodologies, at least once within any 12-month period, the Index Committee reviews the methodology to ensure the indices continue to achieve the stated objectives, and that the data and methodology remain effective. In certain instances, S&P Dow Jones Indices may publish a consultation inviting comments from external parties.

For information on Quality Assurance and Internal Reviews of Methodology, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology and/or Fixed Income Policies & Practices Methodology.

Index Policy

Announcements

Announcements of the daily index values are made after the market close each day.

Holiday Schedule

Each index is calculated daily when the underlying equity index is calculated.

A complete holiday schedule for the year is available at www.spglobal.com/spdji/.

Unexpected Exchange Closures

For information on Unexpected Exchange Closures, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology.

Recalculation Policy

For information on the recalculation policy, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices and Fixed Income Policies & Practices documents for the underlying equity index and bond index, respectively.

For information on Calculations and Pricing Disruptions, Expert Judgment and Data Hierarchy, please refer to S&P Dow Jones Indices' Equity Indices Policies & Practices Methodology and S&P Dow Jones Indices' Fixed Income Policies & Practices Methodology for the underlying equity and bond indices, respectively.

Contact Information

For any questions regarding an index, please contact: index_services@spglobal.com.

Index Dissemination

Index levels are available through S&P Dow Jones Indices' Web site at www.spglobal.com/spdji/, major quote vendors (see codes below), numerous investment-oriented Web sites, and various print and electronic media.

Tickers

The table below lists headline indices covered by this document. All versions of the below indices that may exist are also covered by this document. Please refer to the [S&P DJI Methodology & Regulatory Status Database](#) for a complete list of indices covered by this document.

Index	Bloomberg
S&P 500 Managed Risk 2.0 Index	SPXMR2

Appendix A – Calculating Exponentially Weighted Variance and Covariance

On any business day t , the index calculates the realized short-term and long-term variances and covariances of the underlying equity and fixed income indices. The calculations are based on exponentially weighted moving averages.

The short-term equity variance measure at time t :

$$EquityVariance_{S,t} = \begin{cases} \lambda_S * EquityVariance_{S,t-1} + (1 - \lambda_S) * \left[\ln\left(\frac{E_t}{E_{t-n}}\right) \right]^2 & \text{K if } t > T_0 \\ \sum_{i=m+1}^{T_0} \frac{\alpha_{S,i,m}}{WF_S} * \left[\ln\left(\frac{E_i}{E_{i-n}}\right) \right]^2 & \text{K if } t = T_0 \end{cases}$$

(A.1a)

The long-term equity variance measure at time t :

$$EquityVariance_{L,t} = \begin{cases} \lambda_L * EquityVariance_{L,t-1} + (1 - \lambda_L) * \left[\ln\left(\frac{E_t}{E_{t-n}}\right) \right]^2 & \text{K if } t > T_0 \\ \sum_{i=m+1}^{T_0} \frac{\alpha_{L,i,m}}{WF_L} * \left[\ln\left(\frac{E_i}{E_{i-n}}\right) \right]^2 & \text{K if } t = T_0 \end{cases}$$

(A.1b)

The short-term fixed income variance measure at time t :

$$FIVariance_{S,t} = \begin{cases} \lambda_S * FIVariance_{S,t-1} + (1 - \lambda_S) * \left[\ln\left(\frac{B_t}{B_{t-n}}\right) \right]^2 & \text{K if } t > T_0 \\ \sum_{i=m+1}^{T_0} \frac{\alpha_{S,i,m}}{WF_S} * \left[\ln\left(\frac{B_i}{B_{i-n}}\right) \right]^2 & \text{K if } t = T_0 \end{cases}$$

(A.2a)

The long-term fixed income variance measure at time t :

$$FIVariance_{L,t} = \begin{cases} \lambda_L * FIVariance_{L,t-1} + (1 - \lambda_L) * \left[\ln\left(\frac{B_t}{B_{t-n}}\right) \right]^2 & \text{K if } t > T_0 \\ \sum_{i=m+1}^{T_0} \frac{\alpha_{L,i,m}}{WF_L} * \left[\ln\left(\frac{B_i}{B_{i-n}}\right) \right]^2 & \text{K if } t = T_0 \end{cases}$$

(A.2b)

The short-term covariance measure at time t :

$$Covariance_{S,t} = \begin{cases} \lambda_S * Covariance_{S,t-1} + (1 - \lambda_S) * \left[\ln\left(\frac{E_t}{E_{t-n}}\right) \right] \left[\ln\left(\frac{B_t}{B_{t-n}}\right) \right] K & \text{if } K \ t > T_0 \\ \sum_{i=m+1}^{T_0} \frac{\alpha_{S,i,m}}{WF_S} * \left[\ln\left(\frac{E_t}{E_{t-n}}\right) \right] \left[\ln\left(\frac{B_i}{B_{i-n}}\right) \right] K & \text{if } K \ t = T_0 \end{cases} \quad (A.3a)$$

The long-term covariance measure at time t :

$$Covariance_{L,t} = \begin{cases} \lambda_L * Covariance_{L,t-1} + (1 - \lambda_L) * \left[\ln\left(\frac{E_t}{E_{t-n}}\right) \right] \left[\ln\left(\frac{B_t}{B_{t-n}}\right) \right] K & \text{if } K \ t > T_0 \\ \sum_{i=m+1}^{T_0} \frac{\alpha_{L,i,m}}{WF_L} * \left[\ln\left(\frac{E_t}{E_{t-n}}\right) \right] \left[\ln\left(\frac{B_i}{B_{i-n}}\right) \right] K & \text{if } K \ t = T_0 \end{cases} \quad (A.3b)$$

where:

E_t = The underlying equity index level at time t .

B_t = The underlying fixed income index level at time t .

T_0 = The start date of the S&P Managed Risk 2.0 Index.

n = The number of days in the return calculation. $n = 1$ as daily returns are used to calculate realized volatility.

λ_S = The short-term decay factor used for exponential weighting. The decay factor is a number greater than zero and less than one that determines the weight of each daily return in the calculation of historical variance. $\lambda_S = 0.94$.

λ_L = The long-term decay factor used for exponential weighting. The decay factor is a number greater than zero and less than one that determines the weight of each daily return in the calculation of historical variance. $\lambda_L = 0.97$.

$\alpha_{S,m,i}$ = Weight of date t in the short-term volatility calculation, as determined based on the following formulae:

$$\alpha_{S,t} = (1 - \lambda_S) * \lambda_S^{N+m-i} \quad (A.4a)$$

$$WF_S = \sum_{i=m+1}^{T_0} \alpha_{S,i,m} \quad (A.4b)$$

$\alpha_{L,m,i}$ = Weight of date t in the long-term volatility calculation, as determined based on the following formulae:

$$\alpha_{L,t} = (1 - \lambda_L) * \lambda_L^{N+m-i} \quad (A.5a)$$

$$WF_L = \sum_{i=m+1}^{T_0} \alpha_{L,i,m} \quad (A.5b)$$

m = The m^{th} trading date prior to T_0 .

N = The number of trading days observed for calculating the initial variance as of the start date of the index. $N = 60$.

Appendix B – Setting the Current Target Variance

Volatility of the index is allowed to deviate by a small threshold amount from the target level in order to reduce the occurrence of minor asset weight adjustments.

$$\sigma - \varepsilon \leq \sigma_t \leq \sigma + \varepsilon \quad (\text{B.1})$$

Neither the short- nor long-term volatility of the underlying portfolio should substantially exceed the target level. The current target variance is defined as:

$$\sigma_t^2 = \min((\sigma + \varepsilon)^2, \max((\sigma - \varepsilon)^2, \text{Variance}_{S,t}, \text{Variance}_{L,t})) \quad (\text{B.2})$$

where:

$\text{Variance}_{S,t}$ = Short-term variance of the portfolio calculated as:

$$\text{Variance}_{S,t} = \frac{mmw_{E,t}^2 * \text{EquityVariance}_{S,t} + \left(mmw_{B,t} + H \frac{M}{D}\right)^2 * \text{FIVariance}_{S,t} + 2 * mmw_{E,t} * \left(mmw_{B,t} + H \frac{M}{D}\right) * \text{Covariance}_{S,t}}{(1+H)^2} \quad (\text{B.3a})$$

$\text{Variance}_{L,t}$ = Long-term variance of the portfolio calculated as:

$$\text{Variance}_{L,t} = \frac{mmw_{E,t}^2 * \text{EquityVariance}_{L,t} + \left(mmw_{B,t} + H \frac{M}{D}\right)^2 * \text{FIVariance}_{L,t} + 2 * mmw_{E,t} * \left(mmw_{B,t} + H \frac{M}{D}\right) * \text{Covariance}_{L,t}}{(1+H)^2} \quad (\text{B.3b})$$

Appendix C – Relaxing the Leverage Constraints

Zero volatility managed weights imply a long fixed income weight of:

$$tw_{B,t} = -H_t * \frac{M}{D}$$

This may exceed one if $M > D$ and $H \approx -1$. Leveraged and short positions are avoided, but in this case a small amount of leverage is permitted in the volatility managed fixed income weight in order to include zero volatility in the solution domain. This requires a small relaxation of the constraint (7c) by replacing it with:

$$\theta * tw_{E,t} + tw_{B,t} \leq \theta \tag{C.1}$$

where:

$$\theta = \max\left(-H \frac{M}{D}, 1\right) \tag{C.2}$$

Note that this is merely a technical consideration since the final fixed income weight $w_{B,t}$ is capped and thus will not result in a leveraged portfolio holding.

Appendix D – Calculating Volatility Managed Weights

The volatility management weights are the solution to a quadratic program. This Appendix provides a step-by-step algorithm to find the solution.

As the solution to a convex quadratic program, the volatility management weights are found on the boundary implied by the constraints (7a), (7b), (C.1), (7d) and (7e).

Candidate Boundary Solution Points

Maximum Leverage Boundary. The first boundary considered is the maximum leverage boundary corresponding to constraint (C.1):

$$\theta * tw_{E,t} + tw_{B,t} = \theta$$

There are up to four points on this boundary matching the current target variance:

$$vmw_{E,t} = \frac{(\theta * FIVariance_{S,t} - Covariance_{S,t}) * \frac{\theta + H \frac{M}{D}}{1+H}}{EquityVariance_{S,t} - 2\theta * Covariance_{S,t} + \theta^2 * FIVariance_{S,t}} \pm \sqrt{\frac{(EquityVariance_{S,t} - 2\theta * Covariance_{S,t} + \theta^2 * FIVariance_{S,t}) * \sigma_t^2 - (EquityVariance_{S,t} * FIVariance_{S,t} - Covariance_{S,t}^2) \left(\frac{\theta + H \frac{M}{D}}{1+H} \right)^2}{EquityVariance_{S,t} - 2\theta * Covariance_{S,t} + \theta^2 * FIVariance_{S,t}}} \quad (D.1)$$

$$vmw_{E,t} = \frac{(\theta * FIVariance_{L,t} - Covariance_{L,t}) * \frac{\theta + H \frac{M}{D}}{1+H}}{EquityVariance_{L,t} - 2\theta * Covariance_{L,t} + \theta^2 * FIVariance_{L,t}} \pm \sqrt{\frac{(EquityVariance_{L,t} - 2\theta * Covariance_{L,t} + \theta^2 * FIVariance_{L,t}) * \sigma_t^2 - (EquityVariance_{L,t} * FIVariance_{L,t} - Covariance_{L,t}^2) \left(\frac{\theta + H \frac{M}{D}}{1+H} \right)^2}{EquityVariance_{L,t} - 2\theta * Covariance_{L,t} + \theta^2 * FIVariance_{L,t}}} \quad (D.2)$$

And corresponding volatility managed fixed income weight:

$$vmw_{B,t} = \frac{\theta + H \frac{M}{D}}{1+H} - \theta * vmw_{E,t} \quad (D.3)$$

Minimum Fixed Income Boundary. The second boundary considered is the Minimum fixed income boundary corresponding to constraint (7e):

$$tw_{B,t} = 0$$

There are up to four points on this boundary matching the current target variance:

$$vmw_{E,t} = \frac{-\frac{H}{1+H}\frac{M}{D}Covariance_{S,t} \pm \sqrt{\sigma_t^2 EquityVariance_{S,t} - \left(\frac{H}{1+H}\frac{M}{D}\right)^2 (EquityVariance_{S,t} * FIVariance_{S,t} - Covariance_{S,t}^2)}}{EquityVariance_{S,t}} \quad (D.4)$$

$$vmw_{E,t} = \frac{-\frac{H}{1+H}\frac{M}{D}Covariance_{L,t} \pm \sqrt{\sigma_t^2 EquityVariance_{L,t} - \left(\frac{H}{1+H}\frac{M}{D}\right)^2 (EquityVariance_{L,t} * FIVariance_{L,t} - Covariance_{L,t}^2)}}{EquityVariance_{L,t}} \quad (D.5)$$

And corresponding volatility managed fixed income weight:

$$vmw_{B,t} = \frac{H}{1+H}\frac{M}{D} \quad (D.6)$$

Target Variance Boundary. The maximum target equity weight obtained while matching the current target variance must be one of the following four points.

The short-term volatility boundary corresponding to constraint (7a)

$$tw_{E,t}^2 * EquityVariance_{S,t} + tw_{B,t}^2 * FIVariance_{S,t} + 2 * tw_{E,t} * tw_{B,t} * Covariance_{S,t} = \sigma_t^2$$

has one solution:

$$vmw_{E,t} = \sigma_t * \sqrt{\frac{FIVariance_{S,t}}{EquityVariance_{S,t} * FIVariance_{S,t} - Covariance_{S,t}^2}} \quad (D.7)$$

$$vmw_{B,t} = -\frac{Covariance_{S,t}}{FIVariance_{S,t}} * vmw_{E,t} \quad (D.8)$$

The long-term volatility boundary corresponding to constraint (7b)

$$tw_{E,t}^2 * EquityVariance_{L,t} + tw_{B,t}^2 * FIVariance_{L,t} + 2 * tw_{E,t} * tw_{B,t} * Covariance_{L,t} = \sigma_t^2$$

has one solution:

$$vmw_{E,t} = \sigma_t * \sqrt{\frac{FIVariance_{L,t}}{EquityVariance_{L,t} * FIVariance_{L,t} - Covariance_{L,t}^2}} \quad (D.9)$$

$$vmw_{B,t} = -\frac{Covariance_{L,t} * vmv_{E,t}}{FIVariance_{L,t}} \quad (D.10)$$

The intersection of the short- and long-term volatility boundaries has four points:

$$vmw_{E,t} = \mu\lambda \quad (D.11)$$

$$vmw_{B,t} = (1 - \mu)\lambda \quad (D.12)$$

where:

$$\mu = \frac{FIDiff - CovDiff \pm \sqrt{CovDiff^2 - EqDiff * FIDiff}}{EqDiff - 2 * CovDiff + FIDiff} \quad (D.13)$$

$$\lambda = \frac{\sigma_t}{\sqrt{(EquityVariance_{S,t} - 2 * Covariance_{S,t} + FIVariance_{S,t}) * \mu^2 + 2 * (Covariance_{S,t} - FIVariance_{S,t}) * \mu + FIVariance_{S,t}}} \quad (D.14)$$

$$EqDiff = EquityVariance_{S,t} - EquityVariance_{L,t} \quad (D.15)$$

$$FIDiff = FIVariance_{S,t} - FIVariance_{L,t} \quad (D.16)$$

$$CovDiff = Covariance_{S,t} - Covariance_{L,t} \quad (D.17)$$

Maximum Equity Corner. The final boundary point is the corner at the intersection of constraints (7c) and (7e):

$$vmw_{E,t} = \frac{1}{1+H} \quad (D.18)$$

$$vmw_{B,t} = \frac{H \frac{M}{D}}{1+H} \quad (D.19)$$

Selecting the Solution

The values defined in (D.1)-(D.19) are not all well-defined. Only those solutions that are both well-defined and satisfy all the constraints are considered. From these solutions, the one with the greatest equity exposure $vmw_{E,t}$ is selected. In a situation where there is not a unique maximum equity exposure among the candidates, the solution that also maximizes the target fixed income weight $vmw_{B,t}$ will be selected.

Appendix E – Parameters

General Parameters

Interest Rate	U.S. Overnight Federal Funds Rate
Short Term Decay Factor (λ_S):	0.94
Long Term Decay Factor (λ_L):	0.97
Time to Maturity (Put Option), T :	5 Years
Strike Multiplier (k):	0.8
Target Volatility:	22%
Target Volatility Band:	1.0%
Upper Yield Premium:	0.25%
Lower Yield Premium:	0.00%
Maximum Daily Allocation Change:	10%
Protection Mean Reversion Period Down:	2.00
Protection Mean Reversion Period Up:	0.75
Yield Premium Mean Reversion Period:	2.50

Index-Specific Parameters

Index	Underlying Indices			Minimum Daily Allocation Change
	Equity	Fixed Income	Cash Equivalent	
S&P 500 Managed Risk 2.0 Index	S&P 500	S&P U.S. Treasury Bond Current 5-Year Index	S&P U.S. Treasury Bill 0-3 Month Index	3.0%
S&P 400 Managed Risk 2.0 Index	S&P MidCap 400			5.0%
S&P 600 Managed Risk 2.0 Index	S&P SmallCap 600			5.0%
S&P EM 100 Managed Risk 2.0 Index	S&P EM 100			3.0%
S&P EPAC Ex. Korea LargeMidCap Managed Risk 2.0 Index	S&P EPAC Ex. Korea LargeMidCap			5.0%

Currency of Calculation and Additional Index Return Series

The indices calculate in U.S. dollars.

In addition to the indices detailed in this methodology, additional return series versions of the indices may be available, including, but not limited to: currency, currency hedged, decrement, fair value, inverse, leveraged, and risk control versions. For a list of available indices, please refer to the [S&P DJI Methodology & Regulatory Status Database](#).

For information on various index calculations, please refer to S&P Dow Jones Indices' Index Mathematics Methodology.

For the inputs necessary to calculate certain types of indices, including decrement, dynamic hedged, fair value, and risk control indices, please refer to the Parameters documents available at www.spglobal.com/spdji/.

Appendix F – Methodology Changes

Methodology changes since January 23, 2017 are as follows:

Change	Effective Date (After Close)	Previous	Methodology Updated
Mark-to-Market Weights	13-Nov-2020	Mark-to-market weights are determined as: $mmw_{E,t} = \frac{W_{E,t-1} \frac{E_t}{E_{t-1}}}{W_{E,t-1} \frac{E_t}{E_{t-1}} + W_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) \frac{C_t}{C_{t-1}}}$ $mmw_{B,t} = \frac{W_{B,t-1} \frac{B_t}{B_{t-1}}}{W_{E,t-1} \frac{E_t}{E_{t-1}} + W_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) \frac{C_t}{C_{t-1}}}$	Mark-to-market weights are determined as: $mmw_{E,t} = \frac{thw_{E,t-1} \frac{E_t}{E_{t-1}}}{thw_{E,t-1} \frac{E_t}{E_{t-1}} + thw_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - thw_{E,t-1} - thw_{B,t-1}) \frac{C_t}{C_{t-1}}}$ $mmw_{B,t} = \frac{thw_{B,t-1} \frac{B_t}{B_{t-1}}}{thw_{E,t-1} \frac{E_t}{E_{t-1}} + thw_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - thw_{E,t-1} - thw_{B,t-1}) \frac{C_t}{C_{t-1}}}$
Final Asset Weights	13-Nov-2020	The final asset weights are determined by the two-day lagged theoretical weights in the event that a trade was triggered. Otherwise, they are determined by marking to market the prior day's weights: <i>If TradeBoolean_{t-2} = True</i> <i>Then</i> $W_{E,t} = thw_{E,t2}$ $W_{B,t} = thw_{B,t2}$ <i>Else</i> $W_{E,t} = mmw_{E,t}$ $W_{B,t} = mmw_{B,t}$	The final asset weights are determined by the two-day lagged theoretical weights in the event that a trade was triggered. Otherwise, they are determined by marking to market the prior day's weights: <i>If TradeBoolean_{t-2} = True</i> <i>Then</i> $W_{E,t} = thw_{E,t2}$ $W_{B,t} = thw_{B,t2}$ <i>Else</i> $W_{E,t} = \frac{W_{E,t-1} \frac{E_t}{E_{t-1}}}{W_{E,t-1} \frac{E_t}{E_{t-1}} + W_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) \frac{C_t}{C_{t-1}}}$ $W_{B,t} = \frac{W_{B,t-1} \frac{B_t}{B_{t-1}}}{W_{E,t-1} \frac{E_t}{E_{t-1}} + W_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) \frac{C_t}{C_{t-1}}}$
Minimum Daily Allocation Change	20-Mar-2020	--	5% for the S&P 400 Managed Risk 2.0 Index, S&P 600 Managed Risk 2.0 Index, and S&P EPAC Ex. Korea LargeMidCap Managed Risk 2.0 Index. 3% for the S&P 500 Managed Risk 2.0 Index and S&P EM 100 Managed Risk 2.0 Index.
Target Volatility Threshold	20-Mar-2020	0.5%	1%
Mark-to-Market Weights	20-Mar-2020	--	Mark-to-market weights are determined as: $mmw_{E,t} = \frac{W_{E,t-1} \frac{E_t}{E_{t-1}}}{W_{E,t-1} \frac{E_t}{E_{t-1}} + W_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) \frac{C_t}{C_{t-1}}}$ $mmw_{B,t} = \frac{W_{B,t-1} \frac{B_t}{B_{t-1}}}{W_{E,t-1} \frac{E_t}{E_{t-1}} + W_{B,t-1} \frac{B_t}{B_{t-1}} + (1 - W_{E,t-1} - W_{B,t-1}) \frac{C_t}{C_{t-1}}}$
Theoretical Asset Weights	20-Mar-2020	--	Theoretical asset weights are determined as: $thw_{E,t} = \varphi_t * tw_{E,t} + (1 - \varphi_t) * mmw_{E,t}$ $thw_{B,t} = \varphi_t * \min(tw_{B,t}, \omega_t * (1 - tw_{E,t})) + (1 - \varphi_t) * mmw_{B,t}$

Change	Effective Date (After Close)	Previous	Methodology	Updated
Reference Equity Weight	20-Mar-2020	--		Reference equity weight is determined as: <i>If TradeBoolean_{t-1} = True</i> <i>Then</i> $refw_{E,t} = thw_{E,t-1}$ <i>Else</i> $refw_{E,t} = W_{E,t}$
Trade Decision	20-Mar-2020	--		The trade decision is based on the difference between the theoretical and reference equity weights: <i>If</i> $ refw_{E,t} - thw_{E,t} \geq \underline{\delta}$ <i>Then</i> $TradeBoolean_t = True$ <i>Else</i> <i>If</i> $thw_{E,t} = 1$ and $W_{E,t} < 1$ and not ($thw_{E,t-1} = 1$ and $W_{E,t-1} < 1$) <i>Then</i> $TradeBoolean_t = True$ <i>Else</i> $TradeBoolean_t = False$
Final Asset Weights	20-Mar-2020	$W_{E,t} = \varphi_t * tw_{E,t} + (1 - \varphi_t) * W_{E,t-1}$ $W_{B,t} = \varphi_t * \min(tw_{B,t}, \omega_t * (1 - tw_{E,t})) + (1 - \varphi_t) * W_{B,t-1}$		In the event that a trade was triggered, the final asset weights are determined by the two-day lagged theoretical weights. Otherwise, they are determined by marking to market the prior day's weights: <i>If TradeBoolean_{t-2} = True</i> <i>Then</i> $W_{E,t} = thw_{E,t2}$ $W_{B,t} = thw_{B,t2}$ <i>Else</i> $W_{E,t} = mmw_{E,t}$ $W_{B,t} = mmw_{B,t}$
Target Volatility	20-Mar-2020	The target volatility of the index calculated as: $\sigma_t^2 = \min((\sigma + \epsilon)^2, \max((\sigma - \epsilon)^2, Variance_{S,t}, Variance_{L,t}))$ where: $Variance_{S,t}$ = Short-term variance of the portfolio calculated as: $Variance_{S,t} =$ $\frac{W_{E,t-1}^2 * EquityVariance_{S,t} + (W_{B,t-1} + H \frac{M}{D})^2 * FIVariance_{S,t} + 2 * W_{E,t-1} * (W_{B,t-1} + H \frac{M}{D}) * Covariance_{S,t}}{(1 + H)^2}$ $Variance_{L,t}$ = Long-term variance of the portfolio calculated as: $Variance_{L,t} =$ $\frac{W_{E,t-1}^2 * EquityVariance_{L,t} + (W_{B,t-1} + H \frac{M}{D})^2 * FIVariance_{L,t} + 2 * W_{E,t-1} * (W_{B,t-1} + H \frac{M}{D}) * Covariance_{L,t}}{(1 + H)^2}$		The target volatility of the index calculated as: $\sigma_t^2 = \min((\sigma + \epsilon)^2, \max((\sigma - \epsilon)^2, Variance_{S,t}, Variance_{L,t}))$ where: $Variance_{S,t}$ = Short-term variance of the portfolio calculated as: $Variance_{S,t} =$ $\frac{mmw_{E,t}^2 * EquityVariance_{S,t} + (mmw_{B,t} + H \frac{M}{D})^2 * FIVariance_{S,t} + 2 * mmw_{E,t} * (mmw_{B,t} + H \frac{M}{D}) * Covariance_{S,t}}{(1 + H)^2}$ $Variance_{L,t}$ = Long-term variance of the portfolio calculated as: $Variance_{L,t} =$ $\frac{mmw_{E,t}^2 * EquityVariance_{L,t} + (mmw_{B,t} + H \frac{M}{D})^2 * FIVariance_{L,t} + 2 * mmw_{E,t} * (mmw_{B,t} + H \frac{M}{D}) * Covariance_{L,t}}{(1 + H)^2}$

Appendix G – EU Required ESG Disclosures

EXPLANATION OF HOW ENVIRONMENTAL, SOCIAL & GOVERNANCE (ESG) FACTORS ARE REFLECTED IN THE KEY ELEMENTS OF THE BENCHMARK METHODOLOGY¹	
1.	Name of the benchmark administrator. S&P Dow Jones Indices LLC.
2.	Underlying asset class of the ESG benchmark.² N/A
3.	Name of the S&P Dow Jones Indices benchmark or family of benchmarks. S&P DJI Multi-Asset Indices Benchmark Statement
4.	Do any of the indices maintained by this methodology take into account ESG factors? No
Appendix latest update: January 2021	
Appendix first publication: January 2021	

¹ The information contained in this Appendix is intended to meet the requirements of the European Union Commission Delegated Regulation (EU) 2020/1817 supplementing Regulation (EU) 2016/1011 of the European Parliament and of the Council as regards the minimum content of the explanation of how environmental, social and governance factors are reflected in the benchmark methodology.

² The 'underlying assets' are defined in European Union Commission Delegated Regulation (EU) 2020/1816 supplementing Regulation (EU) 2016/1011 of the European Parliament and of the Council as regards the explanation in the benchmark statement of how environmental, social and governance factors are reflected in each benchmark provided and published.

Disclaimer

Performance Disclosure/Back-Tested Data

Where applicable, S&P Dow Jones Indices and its index-related affiliates (“S&P DJI”) defines various dates to assist our clients in providing transparency. The First Value Date is the first day for which there is a calculated value (either live or back-tested) for a given index. The Base Date is the date at which the index is set to a fixed value for calculation purposes. The Launch Date designates the date when the values of an index are first considered live: index values provided for any date or time period prior to the index’s Launch Date are considered back-tested. S&P DJI defines the Launch Date as the date by which the values of an index are known to have been released to the public, for example via the company’s public website or its data feed to external parties. For Dow Jones-branded indices introduced prior to May 31, 2013, the Launch Date (which prior to May 31, 2013, was termed “Date of introduction”) is set at a date upon which no further changes were permitted to be made to the index methodology, but that may have been prior to the Index’s public release date.

Please refer to the methodology for the Index for more details about the index, including the manner in which it is rebalanced, the timing of such rebalancing, criteria for additions and deletions, as well as all index calculations.

Information presented prior to an index’s launch date is hypothetical back-tested performance, not actual performance, and is based on the index methodology in effect on the launch date. However, when creating back-tested history for periods of market anomalies or other periods that do not reflect the general current market environment, index methodology rules may be relaxed to capture a large enough universe of securities to simulate the target market the index is designed to measure or strategy the index is designed to capture. For example, market capitalization and liquidity thresholds may be reduced. In addition, forks have not been factored into the back-test data with respect to the S&P Cryptocurrency Indices. For the S&P Cryptocurrency Top 5 & 10 Equal Weight Indices, the custody element of the methodology was not considered; the back-test history is based on the index constituents that meet the custody element as of the Launch Date. Back-tested performance reflects application of an index methodology and selection of index constituents with the benefit of hindsight and knowledge of factors that may have positively affected its performance, cannot account for all financial risk that may affect results and may be considered to reflect survivor/look ahead bias. Actual returns may differ significantly from, and be lower than, back-tested returns. Past performance is not an indication or guarantee of future results.

Typically, when S&P DJI creates back-tested index data, S&P DJI uses actual historical constituent-level data (e.g., historical price, market capitalization, and corporate action data) in its calculations. As ESG investing is still in early stages of development, certain datapoints used to calculate certain ESG indices may not be available for the entire desired period of back-tested history. The same data availability issue could be true for other indices as well. In cases when actual data is not available for all relevant historical periods, S&P DJI may employ a process of using “Backward Data Assumption” (or pulling back) of ESG data for the calculation of back-tested historical performance. “Backward Data Assumption” is a process that applies the earliest actual live data point available for an index constituent company to all prior historical instances in the index performance. For example, Backward Data Assumption inherently assumes that companies currently not involved in a specific business activity (also known as “product involvement”) were never involved historically and similarly also assumes that companies currently involved in a specific business activity were involved historically too. The Backward Data Assumption allows the hypothetical back-test to be extended over more historical years than would be feasible using only actual data. For more information on “Backward Data Assumption” please refer to the FAQ. The methodology and factsheets of any index that employs backward assumption in the back-tested history will explicitly state so. The methodology will include an Appendix with a table setting forth the specific

data points and relevant time period for which backward projected data was used. Index returns shown do not represent the results of actual trading of investable assets/securities. S&P DJI maintains the index and calculates the index levels and performance shown or discussed but does not manage any assets.

Index returns do not reflect payment of any sales charges or fees an investor may pay to purchase the securities underlying the Index or investment funds that are intended to track the performance of the Index. The imposition of these fees and charges would cause actual and back-tested performance of the securities/fund to be lower than the Index performance shown. As a simple example, if an index returned 10% on a US \$100,000 investment for a 12-month period (or US \$10,000) and an actual asset-based fee of 1.5% was imposed at the end of the period on the investment plus accrued interest (or US \$1,650), the net return would be 8.35% (or US \$8,350) for the year. Over a three-year period, an annual 1.5% fee taken at year end with an assumed 10% return per year would result in a cumulative gross return of 33.10%, a total fee of US \$5,375, and a cumulative net return of 27.2% (or US \$27,200).

Various factors, including external factors beyond S&P DJI's control might necessitate material changes to indices.

To the extent that regulatory authorities allow a rating agency to acknowledge in one jurisdiction a rating issued in another jurisdiction for certain regulatory purposes, S&P Global Ratings reserves the right to assign, withdraw or suspend such acknowledgement at any time and in its sole discretion. S&P Dow Jones Indices, including S&P Global Ratings, disclaim any duty whatsoever arising out of the assignment, withdrawal, or suspension of an acknowledgement as well as any liability for any damage alleged to have been suffered on account thereof. Affiliates of S&P Dow Jones Indices LLC, including S&P Global Ratings, may receive compensation for its ratings and certain credit-related analyses, normally from issuers or underwriters of securities or from obligors. Such affiliates of S&P Dow Jones Indices LLC, including S&P Global Ratings, reserve the right to disseminate its opinions and analyses. Public ratings and analyses from S&P Global Ratings are made available on its Web sites, www.standardandpoors.com (free of charge), and www.ratingsdirect.com and www.globalcreditportal.com (subscription), and may be distributed through other means, including via S&P Global Ratings publications and third-party redistributors. Additional information about our ratings fees is available at www.standardandpoors.com/usratingsfees.

S&P Global keeps certain activities of its various divisions and business units separate from each other to preserve the independence and objectivity of their respective activities. As a result, certain divisions and business units of S&P Global may have information that is not available to other business units. S&P Global has established policies and procedures to maintain the confidentiality of certain nonpublic information received in connection with each analytical process.

In addition, S&P Dow Jones Indices provides a wide range of services to, or relating to, many organizations, including issuers of securities, investment advisers, broker-dealers, investment banks, other financial institutions, and financial intermediaries, and accordingly may receive fees or other economic benefits from those organizations, including organizations whose securities or services they may recommend, rate, include in model portfolios, evaluate, or otherwise address.

Some indices use the Global Industry Classification Standard (GICS[®]), which was developed by, and is the exclusive property and a trademark of, S&P Global and MSCI. Neither MSCI, S&P DJI nor any other party involved in making or compiling any GICS classifications makes any express or implied warranties or representations with respect to such standard or classification (or the results to be obtained by the use thereof), and all such parties hereby expressly disclaim all warranties of originality, accuracy,

completeness, merchantability, or fitness for a particular purpose with respect to any of such standard or classification. Without limiting any of the foregoing, in no event shall MSCI, S&P DJI, any of their affiliates or any third party involved in making or compiling any GICS classifications have any liability for any direct, indirect, special, punitive, consequential or any other damages (including lost profits) even if notified of the possibility of such damages.

S&P Dow Jones Indices products are governed by the terms and conditions of the agreements under which they may be provided. A license is required from S&P Dow Jones Indices to display, create derivative works of and/or distribute any product or service that uses, is based upon and/or refers to any S&P Dow Jones Indices and/or index data.
