

Description

The S&P SmallCap 600® Enhanced Value - Lowest Quintile Index is designed to measure the performance of the 120 lowest-ranked stocks in the S&P SmallCap 600 based on value score. Value scores are calculated using three fundamental measures: book value-to-price, earnings-to-price, and sales-to-price.

Methodology Construction

- **Universe.** Constituents must be members of the S&P SmallCap 600.
- **Constituent Selection.** The selection of index constituents is done as follows:
 1. Value scores are computed for each of the stocks that satisfy the criteria.
 2. The stocks are then ranked based on their value scores. The 120 stocks with the lowest value scores are selected and form the index.
 3. A 20% buffer is applied to stocks already in the index in order to reduce portfolio turnover.
- **Weighting.** The methodology employs a modified market-cap-weighting scheme. Adjusted value scores are calculated for all securities selected for index inclusion.
- **Multiple Share Classes.** Some companies may have more than one share class line in the underlying universe index. Each company is represented once by the most liquid share line, which is generally the company's primary listing.

All information for an index prior to its Launch Date is back-tested, based on the methodology that was in effect on the Launch Date. Back-tested performance, which is hypothetical and not actual performance, is subject to inherent limitations because it reflects application of an Index methodology and selection of index constituents in hindsight. No theoretical approach can take into account all of the factors in the markets in general and the impact of decisions that might have been made during the actual operation of an index. Actual returns may differ from, and be lower than, back-tested returns.
